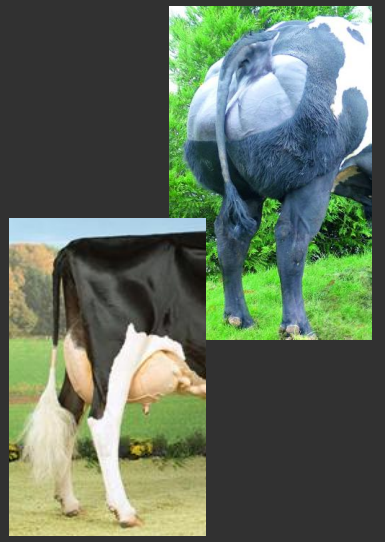
Inherited defects in cattle

Unit of Animal Genomics

- Intensive selection
- Extensive use of AI



- ➢ OUTBURSTS OF INHERITED DEFECTS
  - BLAD (90') = $5 million in US
- Genomic tools improvement
  - High throughput genotyping
  - Next-generation sequencing (NGS)

Highly effective SNP-based association mapping and management of recessive defects in livestock

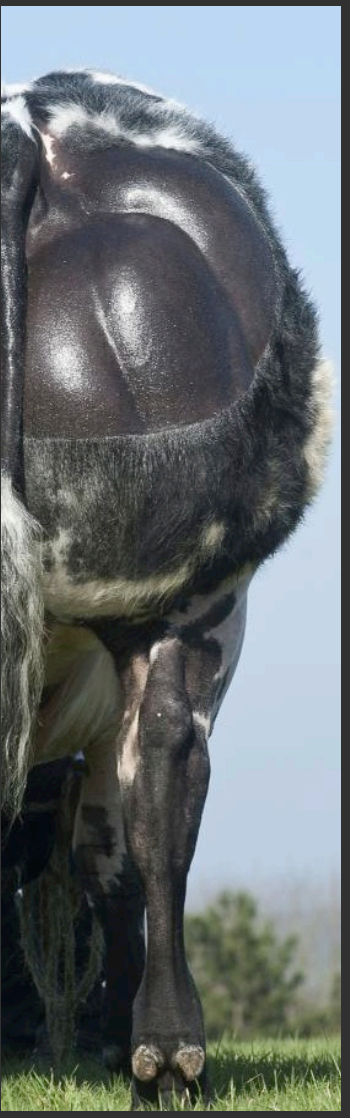
Belgian blue cattle breed

Unit of Animal Genomics



- 50 % belgian cattle & 95 % beef cattle
  - 1.300.000
- 17.000 BBCB herds / 25.000 herds
- Carcass yield = 70 % with 80 % meat
- 99 % calvings by C-section

- Intensive selection for meat production
- Extensive use of AI (50 %)

Heredo-surveillance in cattle…

Unit of Animal Genomics

- Heredo-surveillance platform
  - Useful tool for highly selected breeds
  - Efficiency of the collaboration
  - Useful for emerging diseases (BTV, SBV, …)
- NGS accelerates causative mutation identification process
- Selection based on males
  - Complete & rapid disease eradication
  - Slight carrier frequency decrease
  - Problematic in case of:
    - High carrier frequencies
    - High number of defect
