

8th Symposium ECBHM, 28-30 August 2013, Bern, Switzerland

HAEMATOLOGICAL PROFILES OF CALVES BELONGING TO HERDS WITH BOVINE NEONATAL PANCYTOPENIA HISTORY IN AND AROUND WALLONIA (BELGIUM).

Ronzoni A.,

Bayrou C. , Jolly S., Cassart D., Rao A.-S., Lebrun M.,
Desmecht D., Rollin F., Hanzen C., Théron L.

THE BNP PROJECT

- ✓ Epidemiology, clinical and anatomopathological findings
- ✓ **Detection of SUBCLINICAL calves in BNP herds**
- ✓ Alloantibodies detection by flow cytometry cell sorting
- ✓ 2013-2014: new tools & genetics

BOVINE NEONATAL PANCYTOPENIA

- Syndrome of the **young calf** severe and often-lethal
- Reported in several European countries since **2006**
 - ↑ cases between 2008 and 2010
- Farm Incidence rate between **1%** and **5%**
- Until now up to **≈5000** cases noticed
 - Animal health concern in western world

BOVINE NEONATAL PANCYTOPENIA

Neonate-maternal incompatibility

- ✓ Dams: vaccine-induced alloreactive antibodies

- ✓ Calf: whether they match with cell surface MHC-I antigens

- inherited from the father
- mostly expressed on peripheral and bone marrow leukocytes

BOVINE NEONATAL PANCYTOPENIA

- Young calves **under 4w** (range 10-20 days)
- Both **genders** and different **breeds**
- Well grown and no history of previous ill health
- The **clinical** form characterized by...

BOVINE NEONATAL PANCYTOPENIA

External and internal bleedings

BOVINE NEONATAL PANCYTOPENIA

Petechiae and **ecchymosis**

BOVINE NEONATAL PANCYTOPENIA

Melena or
haematochezia

Occasionally
hyperthermia

Prostration and
sudden death!

BOVINE NEONATAL PANCYTOPENIA

Marked **panleukopenia**

Severe **thrombocytopenia**

Partial or total destruction of the bone marrow

→ **panmyelophthisis**

Questions

- Which are the haematological characteristics of BNP calves versus healthy ones?
- Is there any subclinical case in known BNP farms?

AIM OF THE STUDY

- ✓ Random sampling and haematological analysis in **BNP herds**
- ✓ Verify the hypothesis of **SUBCLINICAL BNP CASES**
- ✓ Better epidemiological picture at herd-level

MATERIALS & METHODS

- 100 calves:

- ✓ **Blood samples**

- jugular vein

- EDTA tubes

- ✓ **Complete haematological profile**

- ✓ **Follow up**

- 12 different farms:

- In and around Wallonia (BE)

- BNP-history

- Between September 2009 and November 2012

RESULTS

CALVES

Breed:

44% BBCB
39% HF
14% crossbred
3% BdA

Age (<4w):

14,8 ± 4,02 days

Gender:

57% F
43% M

Colostrum:

75% mother
25% other dams

RESULTS

DAMS

Parity:
 $2 \pm 2,7$ calving

BVDV vaccination:
82% PregSure BVD®
8% Other

HAEMATOLOGY

RESULTS

HAEMATOLOGY

RESULTS

✓ Follow up **SUBCLINICAL** calves:

4 → healthy

**NORMAL BLOOD
PARAMETERS
AFTER 15-20 DAYS**

1 → **CLINICAL**

DEAD in 72h

DISCUSSION

✓ Bias of our study:

- **Small number** of calves
- **Only BNP** and **BVDV-vaccinated** herds
- **2** different **analysers**

Cell-Dyn Abbott 3500

Beckman Coulter LH750

✓ But...we've answered our questions!

- Significant **haematological** ≠ **NOT-BNP** and **CLINICAL** calves

➤ 5% of SUBCLINICAL BNP calves

➤ 20% risk of become CLINICAL

CONCLUSION

- ✓ Better epidemiological picture of BNP
- ✓ Better management for each CLINICAL calf
 - **COLOSTRUM** management
 - **HAEMATOLOGICAL** profiles of calves with the **same father** if modified parameters
 - preventive blood transfusion

Thank you for your attention!
