Field bordering flower strips not just only improves the biodiversity but also serves as a source of the plants in these strips can be really interesting source of lipids, the oils extracted from their seeds can be important for food, pharmaceutical and cosmetics industries. Six species of plants from flowering strips in Belgium were investigated for their seed oil content. The oil from seeds was extracted by cold extraction technique using chloroform/methanol in 2:1 ratio as solvent. Oil extraction from seeds of Red Clover (Trifolium pratense), Rough Hawkbit (Leontodon hispidus), Cow Parsley (Anthriscus sylvestris), St John's Wort (Hypericum perforatum), Common Yarrow (Achillea millefollium) and Birdsfoot Trefoil (Lotus corniculatus) plant species was done on wet weight which came out to be 7.89±0.11%, 11.86±0.07%, 14.78±0.31%, 24.20±0.02%, 20.08±0.15% and 7.04±0.12% respectively. The physicochemical properties of the extracted oils were analyzed. Some of these oils can be of great commercial value. Keywords: Flowering Strips, Oil, Physicochemical Properties.

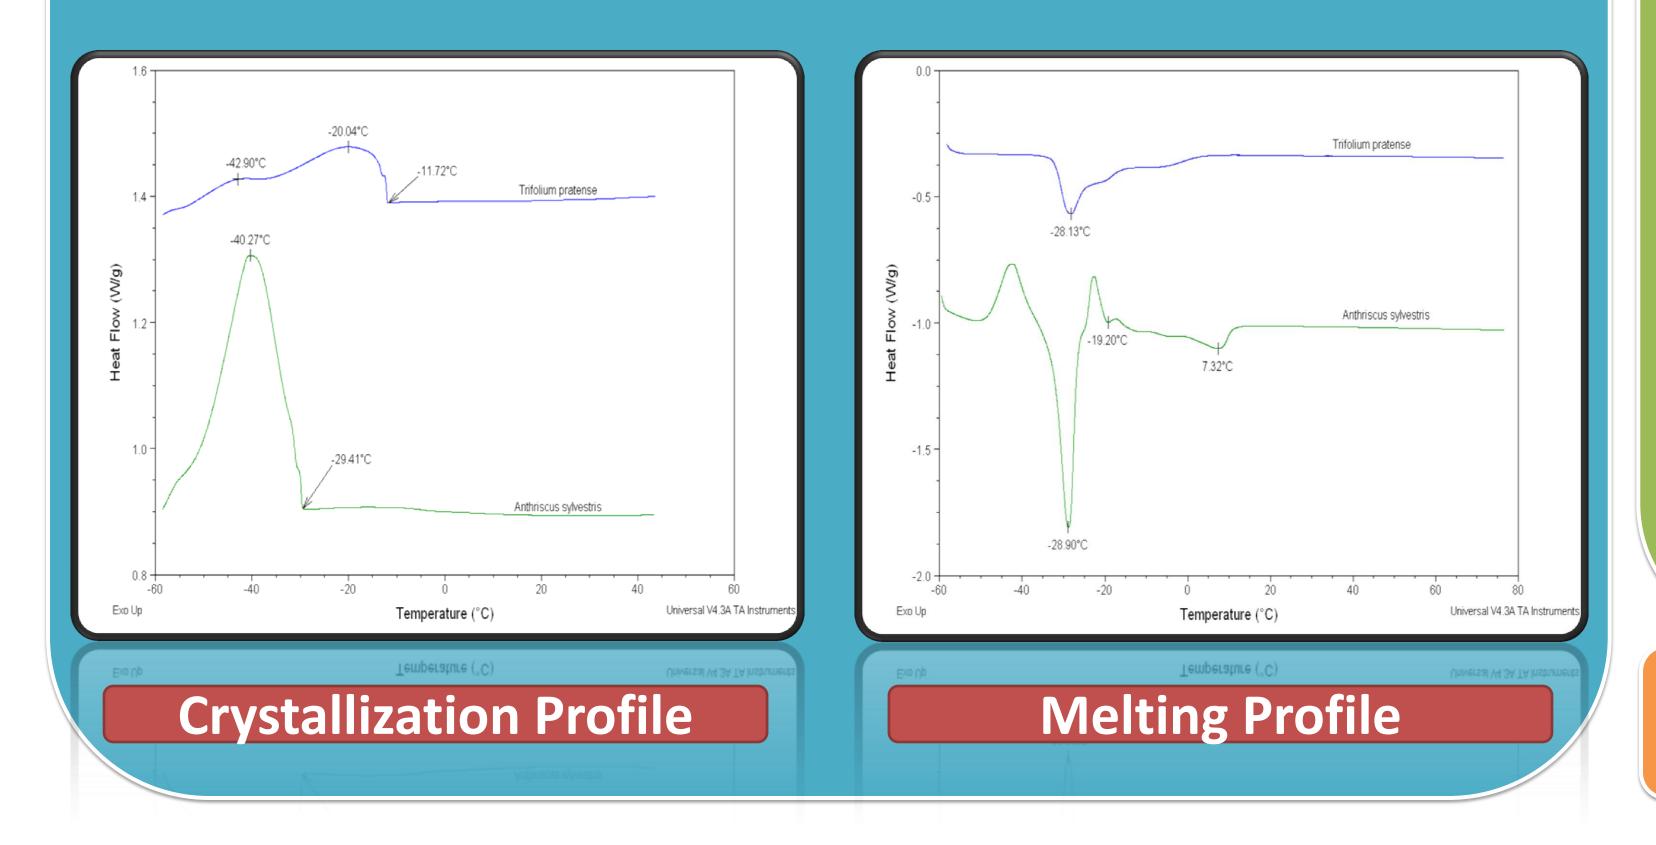

Lipid Content of Seeds	1	Trifolium pratense	7.89± 0.11%	70 60						
	2	Leontodon hispidus	11.86± 0.07	50 - 50 -						
	3	Anthriscus sylvestris	14.78± 0.31%	4 0 30						
	4	Hypericum perforatum	24.20± 0.02%	20 - 10 -						
	5	Achillea millefollium	20.08± 0.15%	0 Trifolium pratense Leotondon hispidus	C 16:0 14.71 11.1	C 18:0 5.67 2.52	C 18:1 11.15 10.42	C 18:2 n6 60.5 72.89	C 18:3 n3 4.39 0.87	Others 3.58 2.2
	6	Lotus corniculatus	7.04±	 Anthriscus sylvestris Hypericum perforatum 	5.49	0.98	50.08 7.52	28.52 41.89	0.89 38.22	14.04 4.34
			0.12%	Achillea millefoliumLotus corniculatus	7.77 12.66	1.11 5.61	8.58 8.43	73.76 55.34	0.47 15.52	8.31 2.44

Thermal Profile (DSC)

1. Oil extraction from seeds of *Trifolium pratense*, *Leontodon hispidus*, *Anthriscus* sylvestris, Hypericum perforatum, Achillea millefollium and Lotus corniculatus plant species was done on wet weight which came out to be 7.89±0.11%, 11.86±0.07%, 14.78±0.31%, 24.20±0.02%, 20.08±0.15% and 7.04±0.12% respectively.

2. Anthriscus sylvestris is good a source of the monounsaturated fatty acid (MUFA) C 18:1 (oleic acid), all the six species are good source of polyunsaturated fatty acid (PUFA) C 18:2 n6 (linoleic acid) and Hypericum perforatum & Lotus *corniculatus* are good source of PUFA C 18:3 n3 (alpha linolenic acid). 3. With this amount of lipids, fatty acid profiles and thermal behaviour some of the seed oils can be important source of commercial lipids.
