IC3D 2013; Liège, Belgium; 3-5 Dec 2013

Problem
IC3D 2013

- Leaf Area Index and Average Leaf Angle are important agronomic parameters for crop grow monitoring
- Their measurement is tedious and require a high work load
- An alternative method should be quicker and present a similar precision
- 2D solution present a saturation problem

- Histogram equalization
- Images rectification
- Computation of xyz coordinate of each pixel ("modified H. Hirschmuller algorithm")
- Image segmentation (Leaves/Soil)
- Computation of the areas
- Leaves

$$
\sum_{\text {riangles }}|\overrightarrow{A B} \times \overrightarrow{A C}| / 2
$$

- Total : based on the mean leave z plane
- LAI = Leave Area / Total Area
- ALA : mean of $\alpha$

$$
\begin{aligned}
& C P=\overrightarrow{A B} \times \overrightarrow{A C} \\
& \alpha=\operatorname{acos}\left(\frac{C P_{z}}{|C P|}\right)
\end{aligned}
$$

3DMEDA Results
IC3D 2013

- Good estimation of the mean distance
- Over-estimation of the measured area
- Both for the laboratory and for the filed tests

| Image sizes | $1024^{*} 768$ |  | $1280 * 960$ |  |
| :--- | :---: | :---: | :---: | :---: |
|  | relative (\%) | $\mathrm{m}^{2}$ | relative <br> $(\%)$ | $\mathrm{m}^{2}$ |
| Accuracy | 34 | 0.0053 | 49 | 0.0075 |
| Precision | 10.9 | 0.0017 | 15.8 | 0.0024 |

Vincent Leemans - Belgium

Results

- Analysis of the error : $\sigma_{z} \approx 3.410^{-4}$
- $\Rightarrow$ estimation of LAI via regression $r=0.93, \quad \sigma_{\text {LAI }}=0.39$, similar to manual measurements
