

## Pharmaceutical Micropollutants in Waste Water: 4 sources

- Hospitals
- Pharmaceutical Industries
- Intensive animal livestocks
- Domestic waste water

## Elimination Processes of micropollutants in WWTP

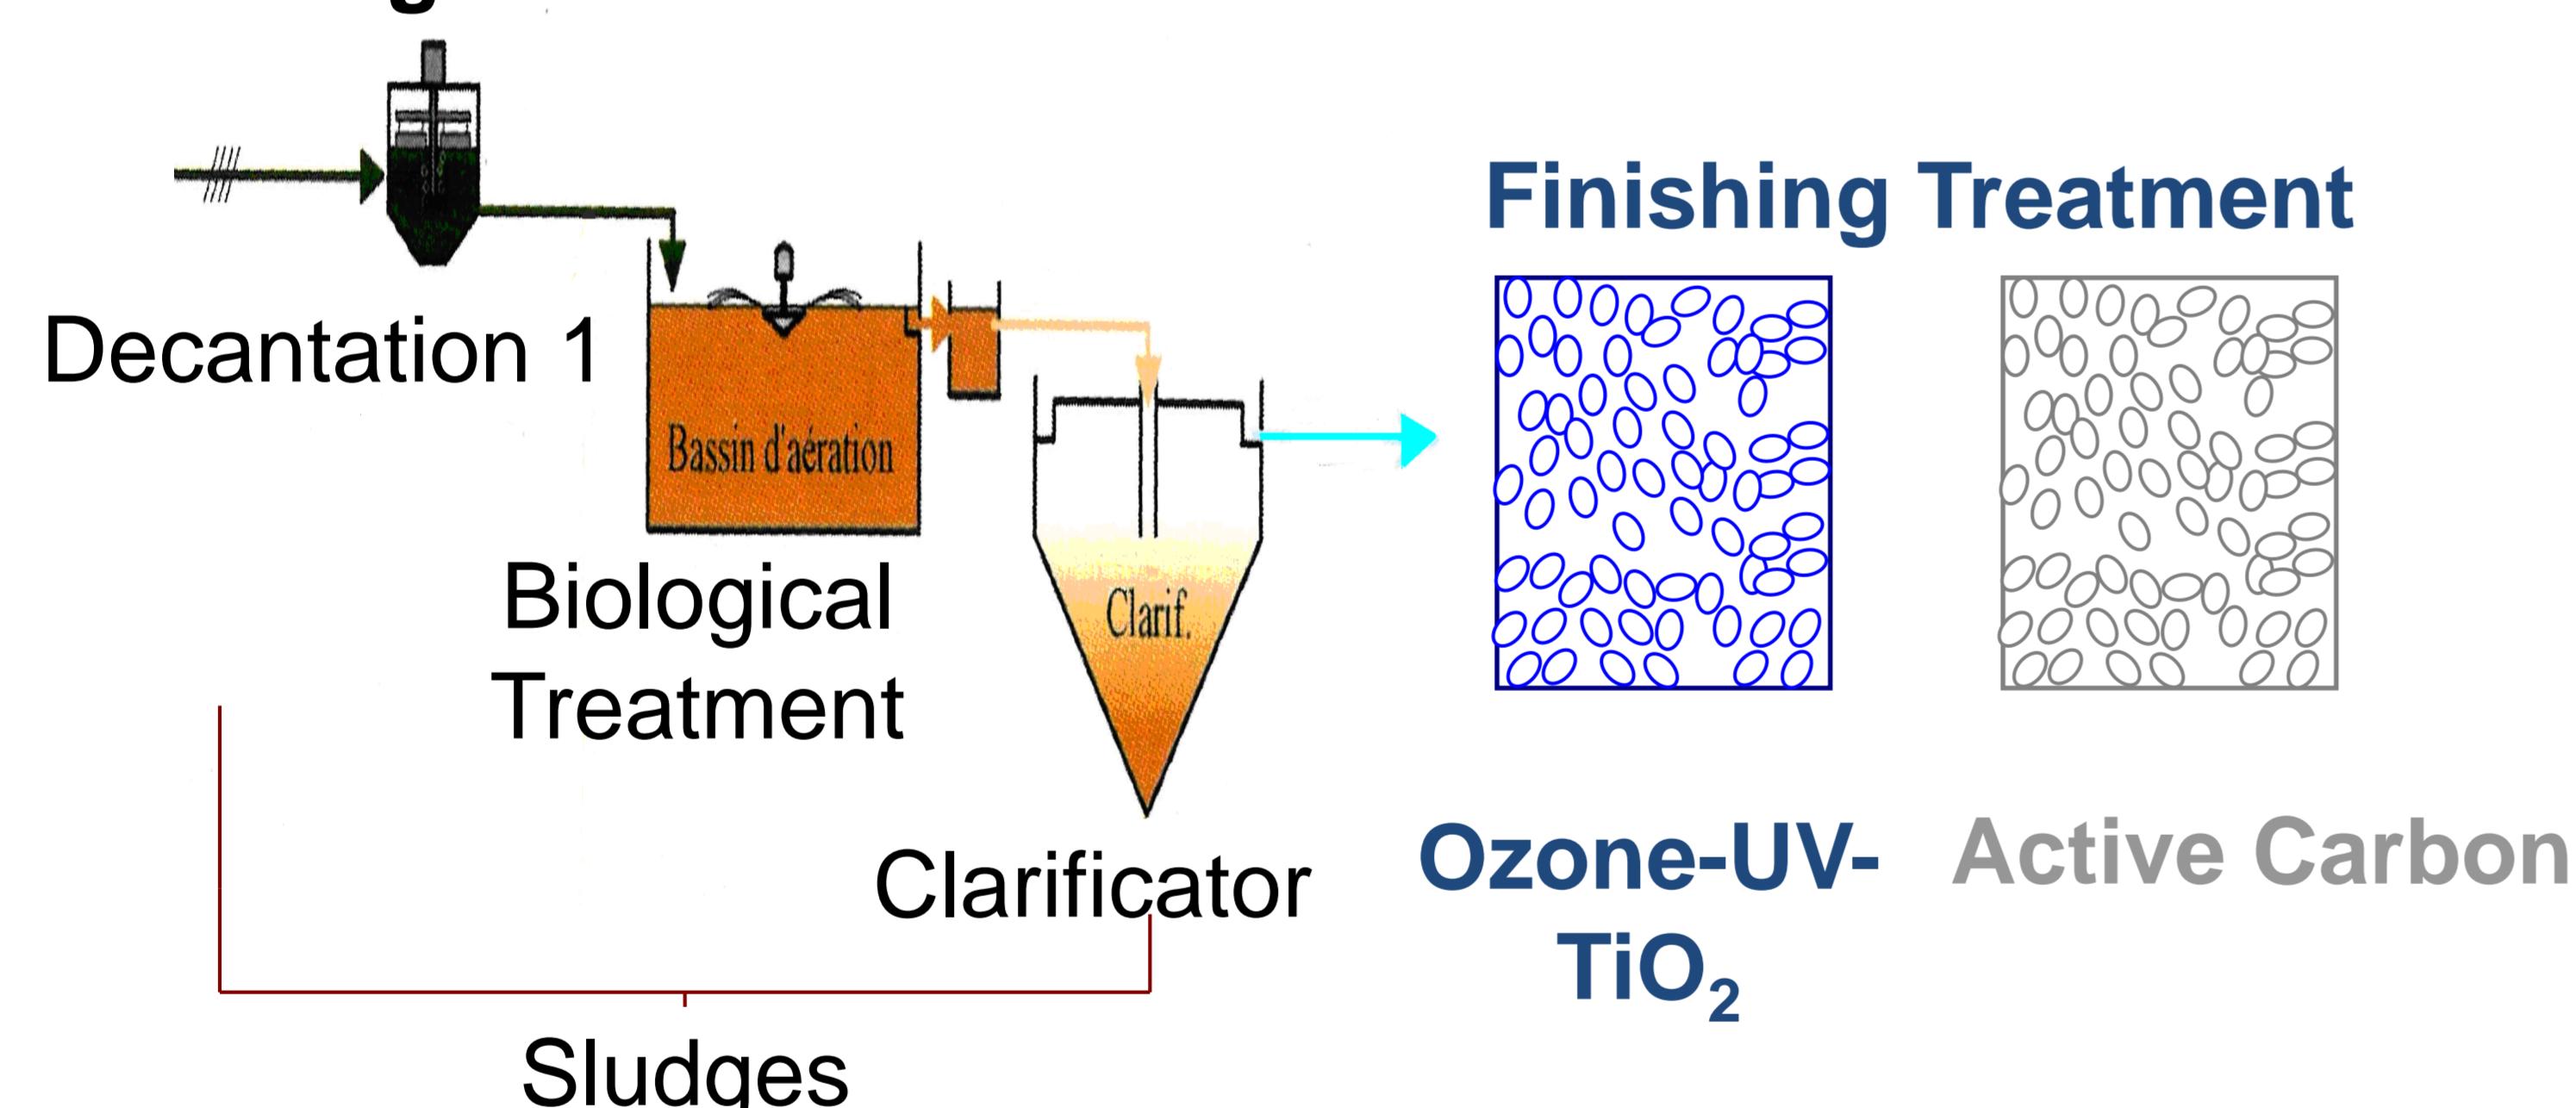

Biological Treatment in WWTP <50% degradation

Reduction of micropollutant by

- 1) ADSORPTION ON SLUDGES
- 2) VOLATILISATION
- 3) BIODEGRADATION

## Scheme of the suggested treatment

### Biological Treatment

### Model water

- Diclofenac, 17 alpha-ethinyl estradiol, 17 beta-oestradiol
- Erythromycine, Clarithromycine, Azithromycine
- Furosémide, Sulfamethoxazole, Carbamazepine

## European Water Directive

2013: diclofenac, 17alpha-ethinyl-estradiol, 17betaoestradiol added to the water directive watching list : Concentration and toxicity data monitored at european scale.

2015: 3 macrolides antibiotics added: erythromycine, clarithromycine, azithromycine

## Toxicity tests

Toxicity measurement of waste waters with daphnies *Daphnia Magna* and fluorescent bacteria *Vibrio fisherii*
