

# Nonlinear analysis of compliant mechanisms: application to tape springs

F. Dewalque and O. Brüls

Department of Aerospace and Mechanical Engineering  
University of Liège, Belgium

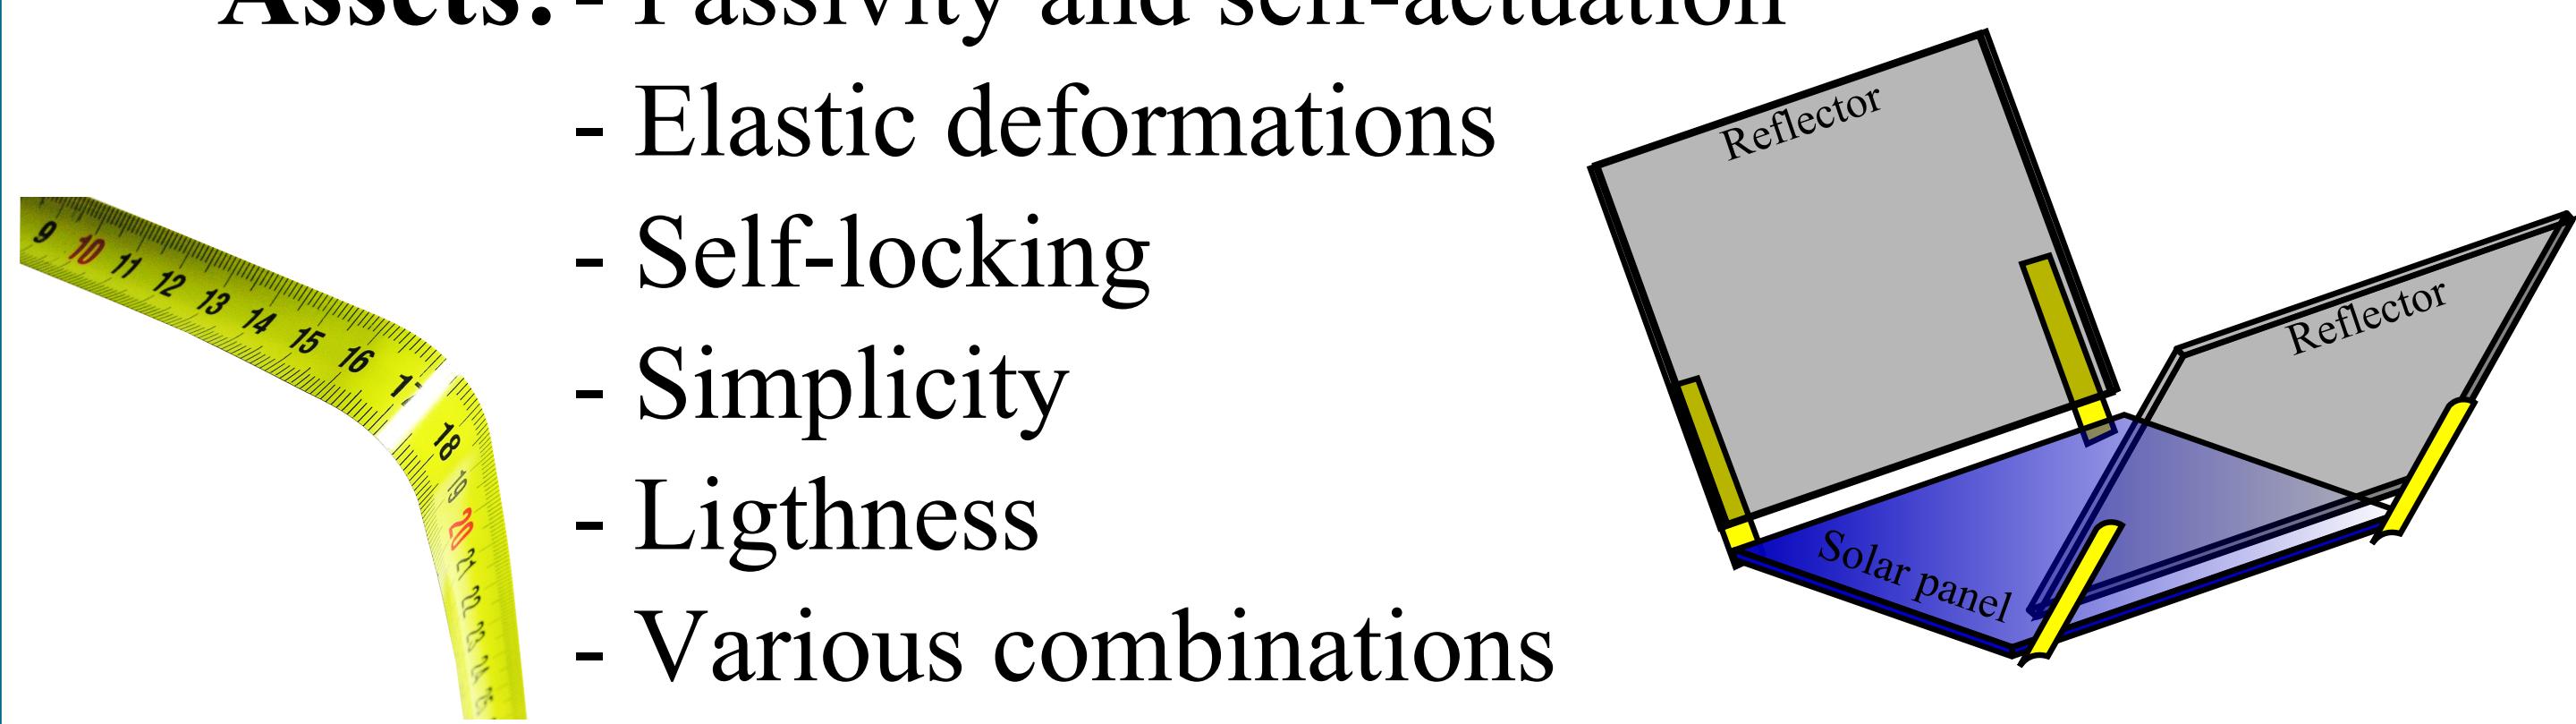

## Tape springs

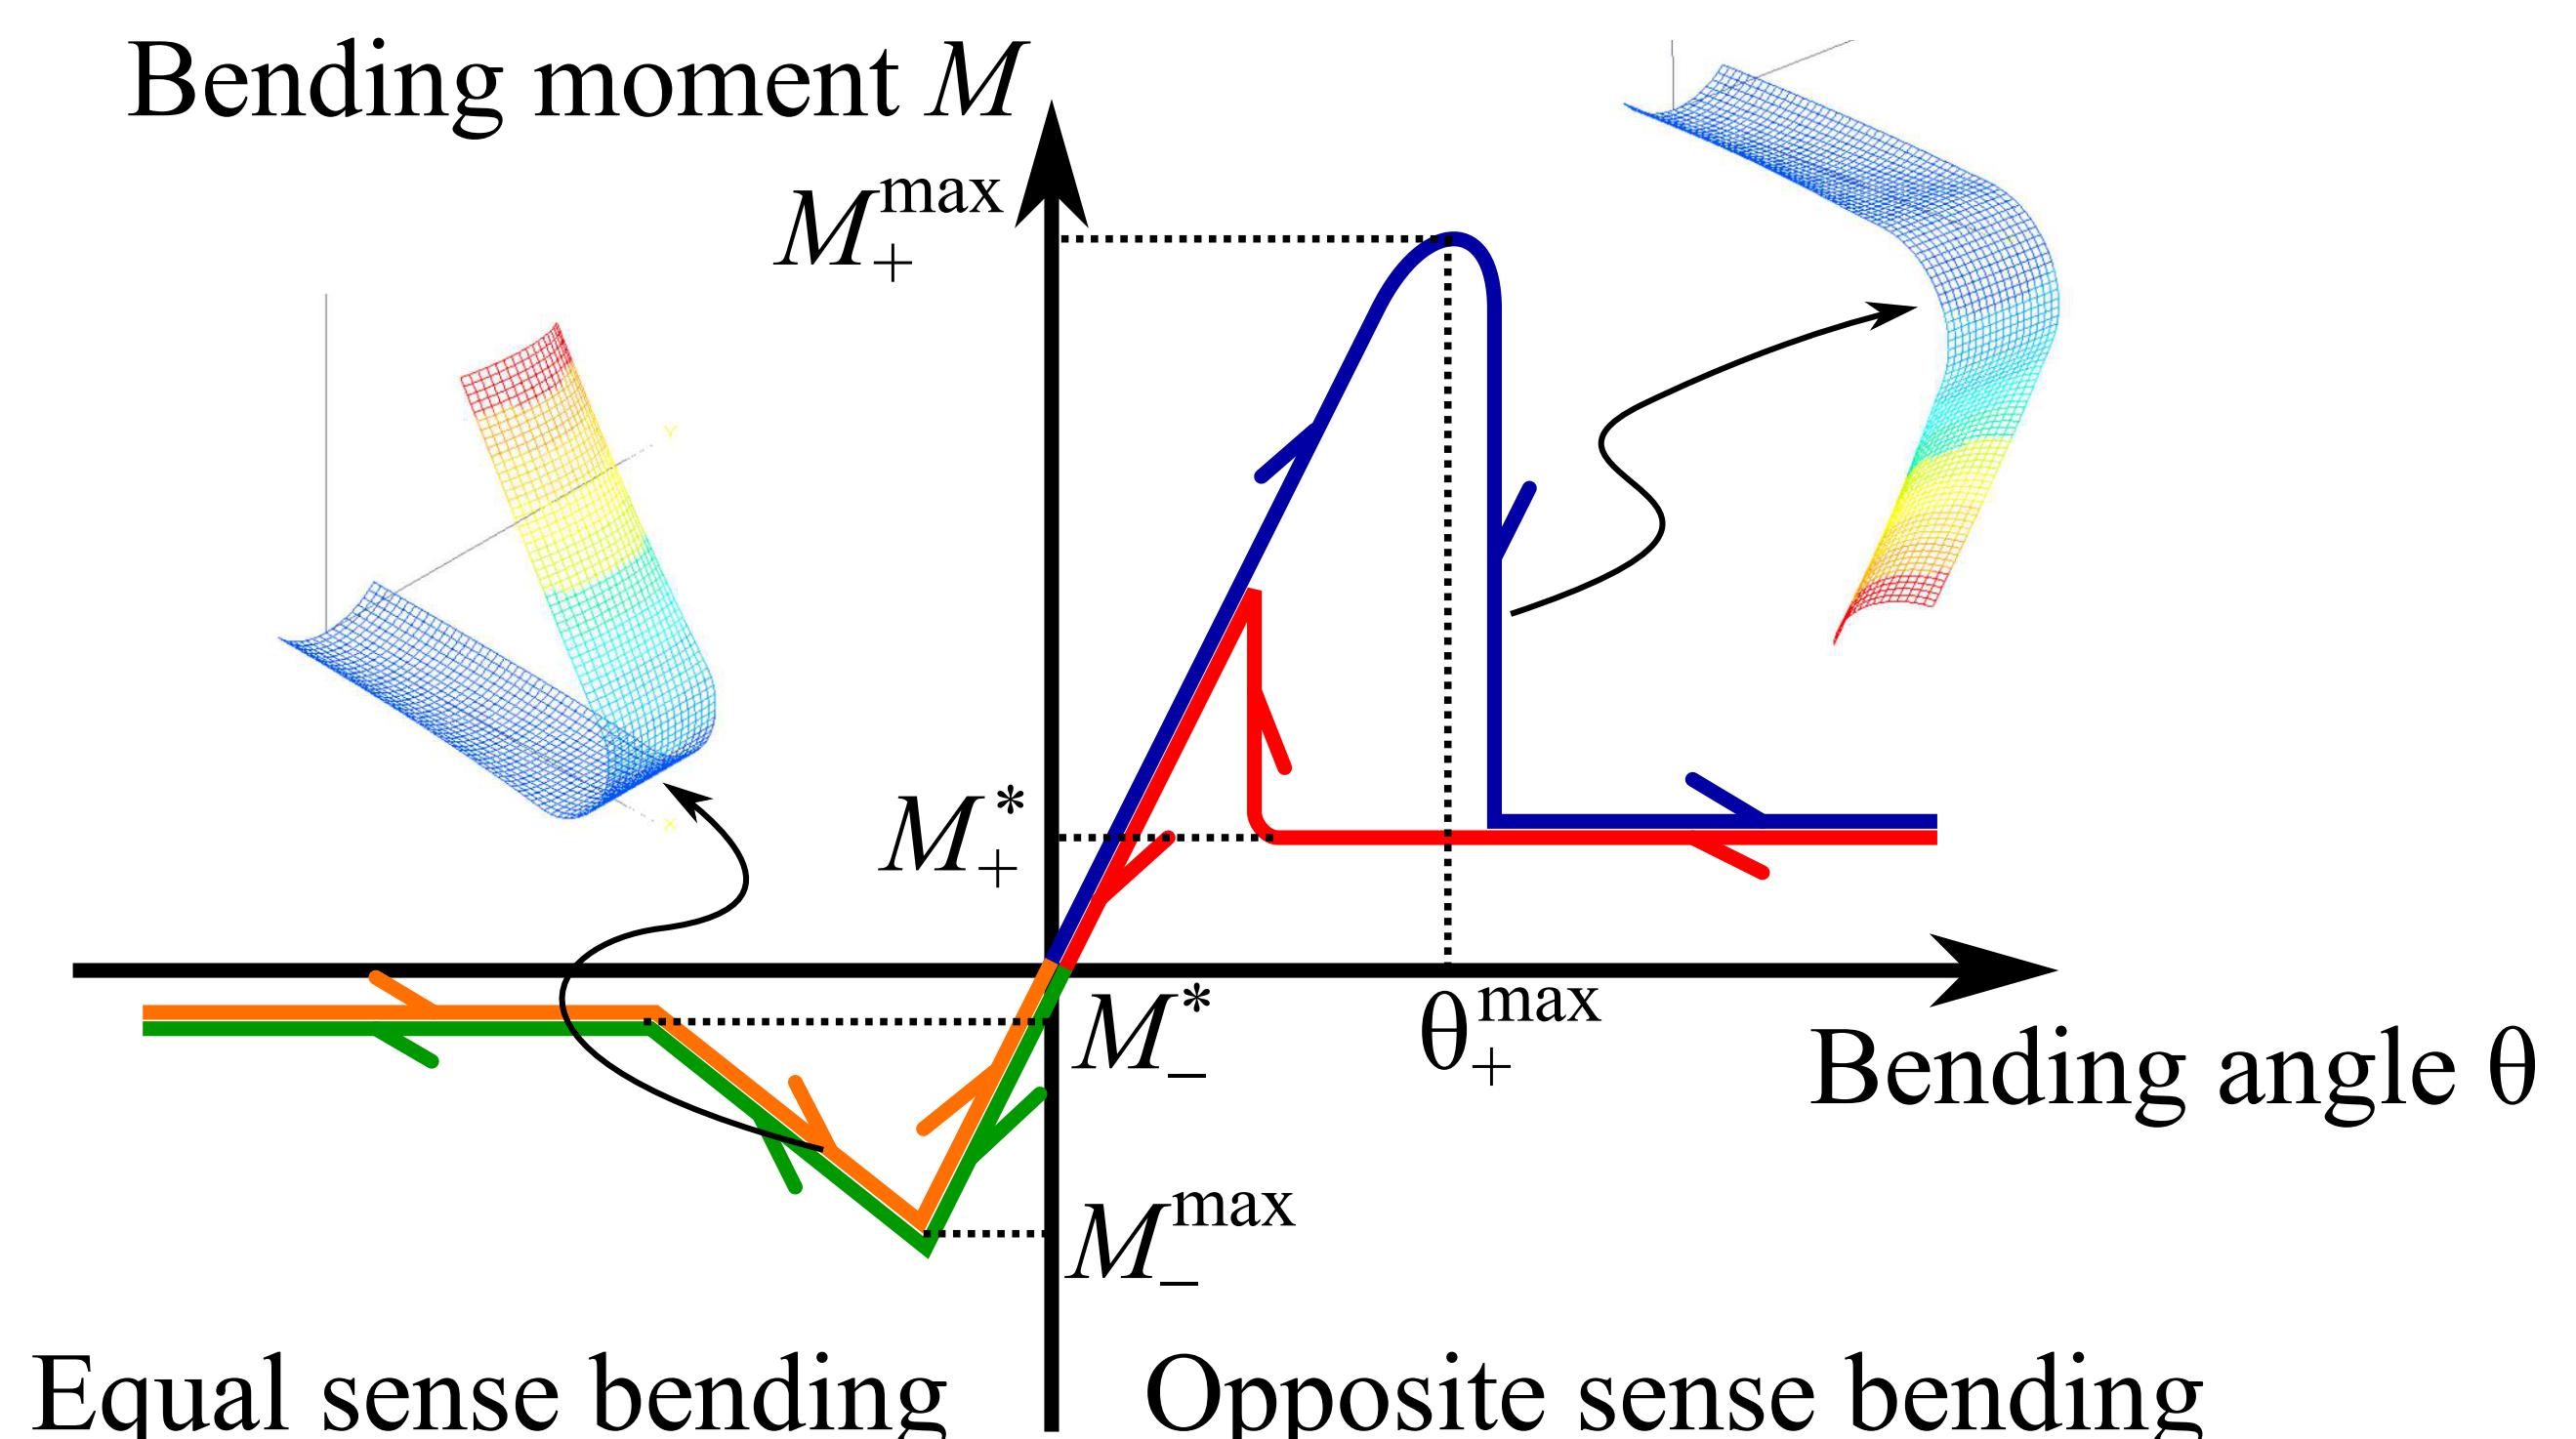

**Definition:** Thin strip curved along its width commonly used in deployable structures

**Assets:**

- Passivity and self-actuation
- Elastic deformations
- Self-locking
- Simplicity
- Lightness
- Various combinations
- Compact folded configuration

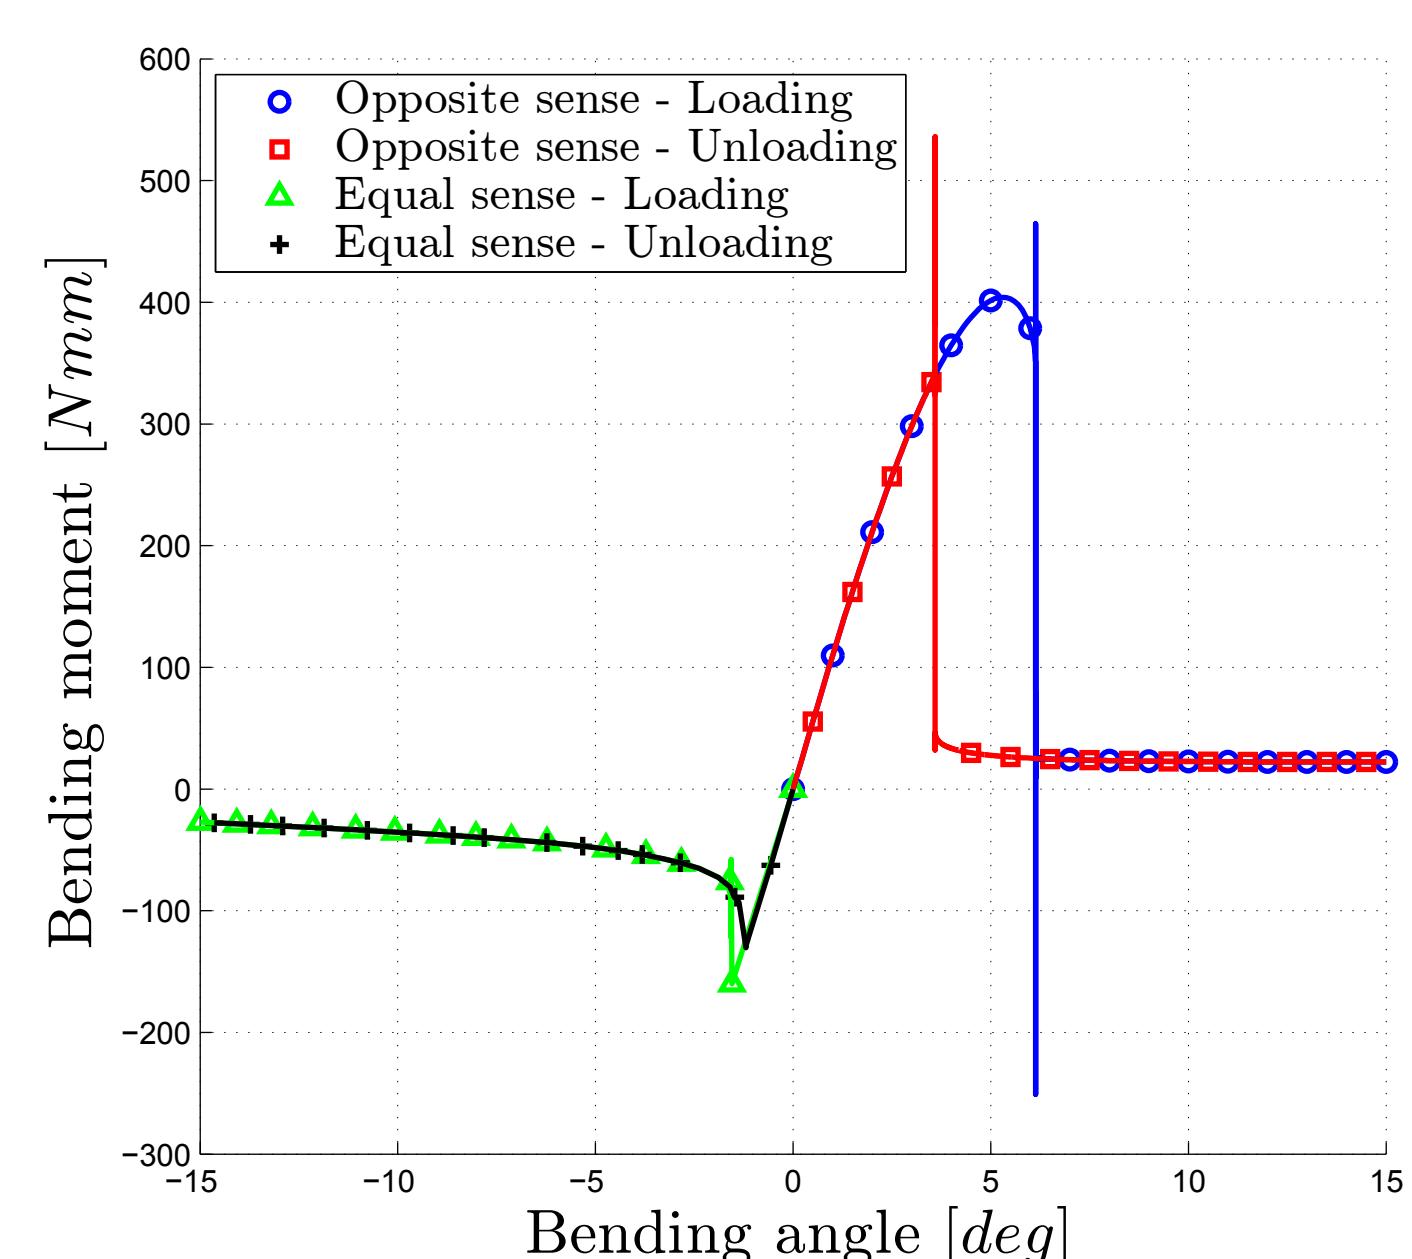

**Theoretical mechanical behaviour:**

## Nonlinear finite element models

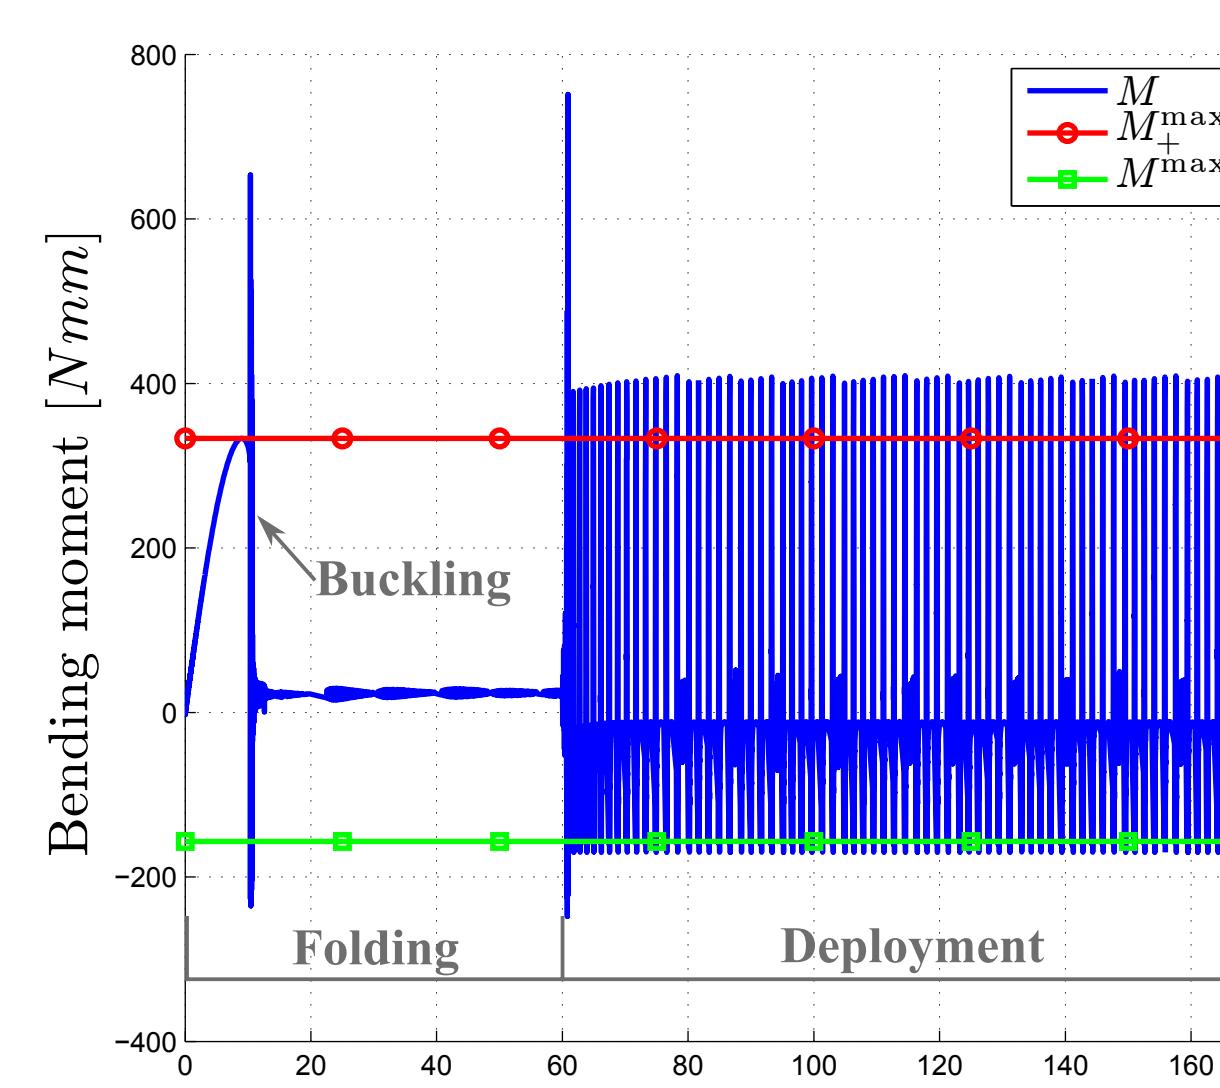

**Quasi-static analyses:**

- Shells
- Newmark or generalised- $\alpha$  method
- Adaptive time stepping procedure
- High numerical damping
- Control on the bending angle

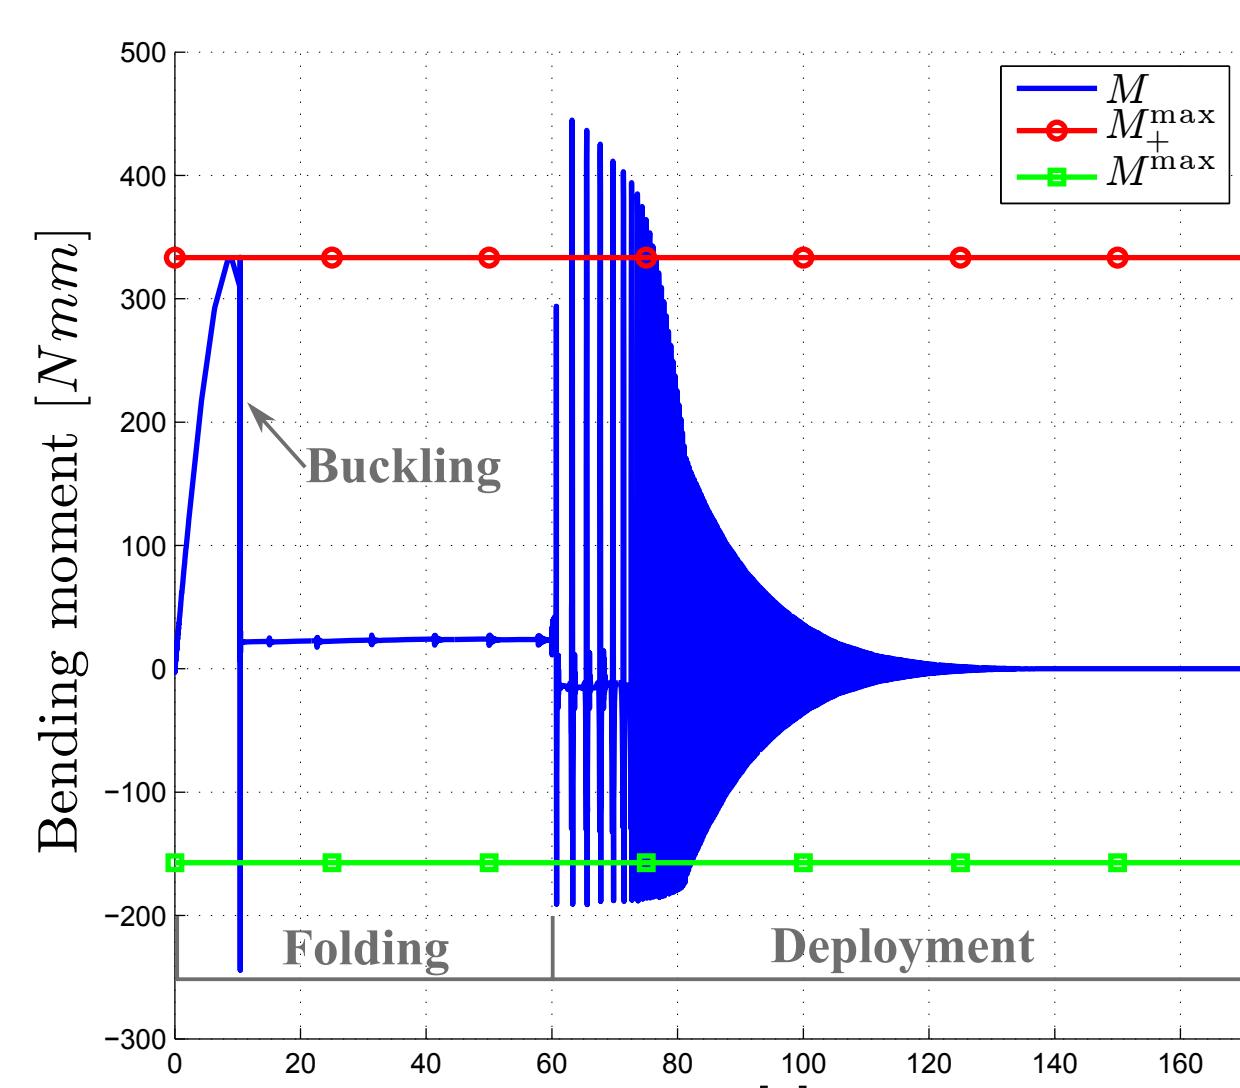

**Dynamic analyses:**

- Shells
- Generalised- $\alpha$  method
- Adaptive time stepping procedure
- Low numerical damping
- Importance of the structural damping

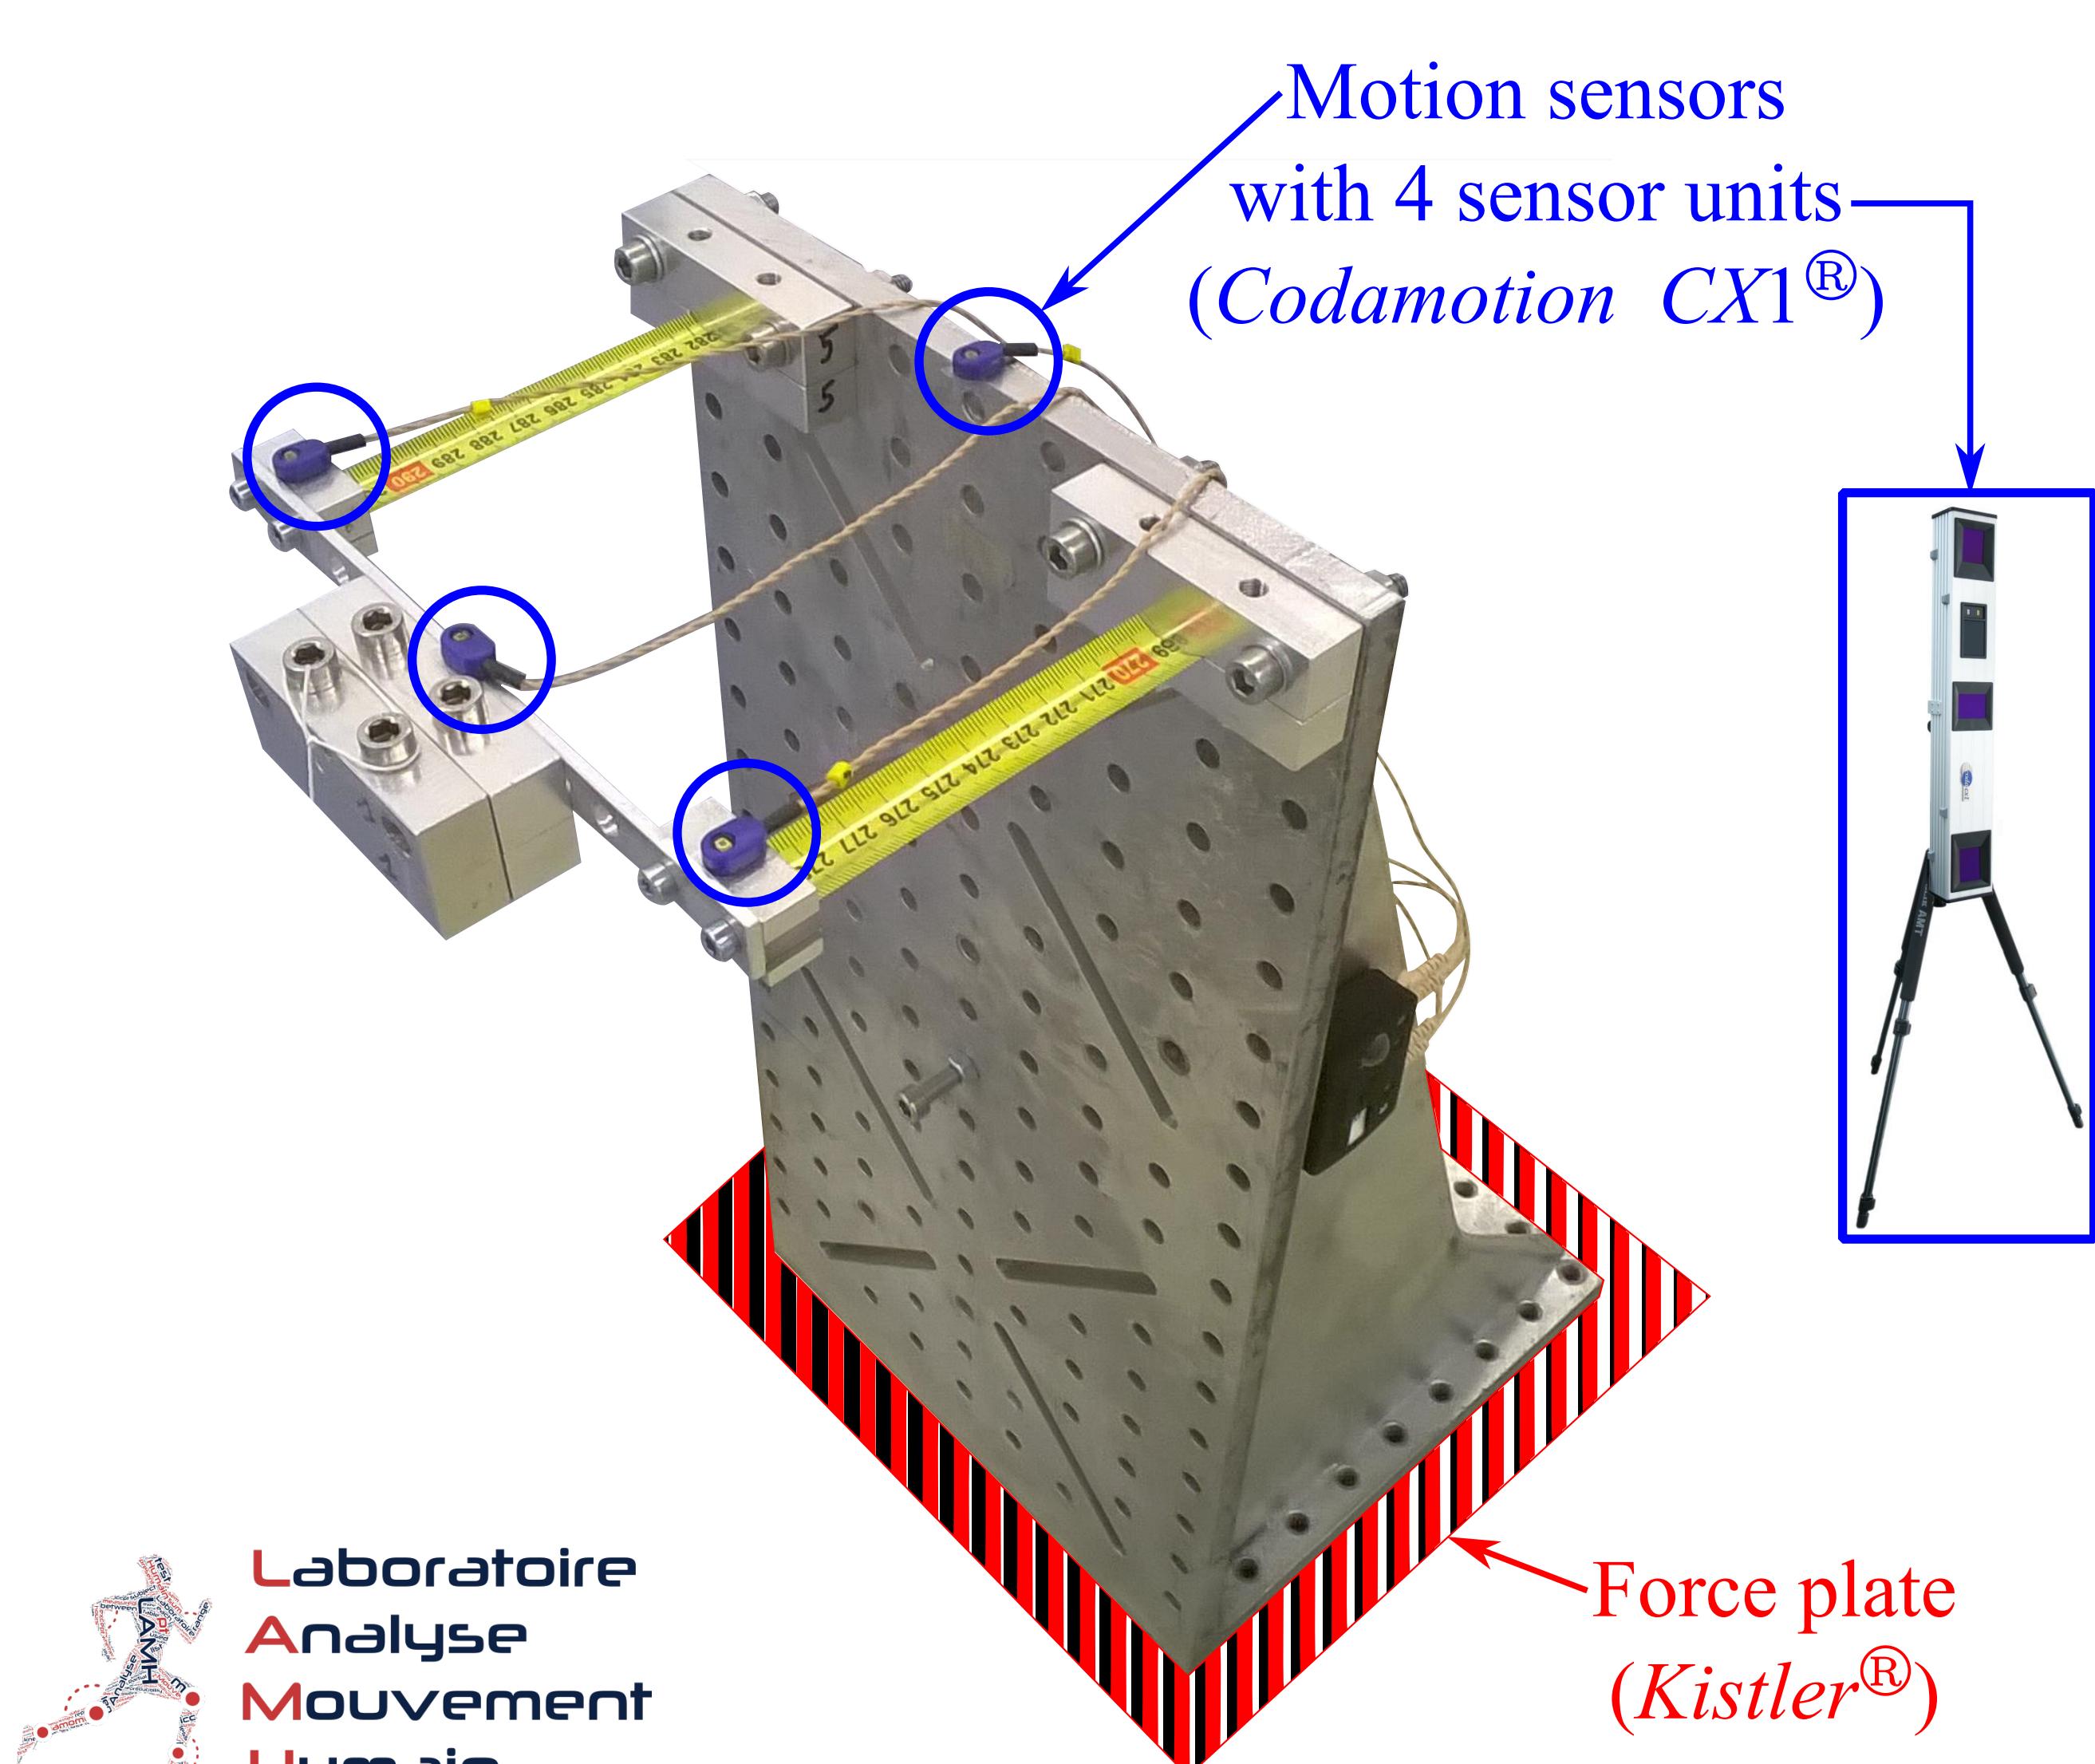

Without structural damping

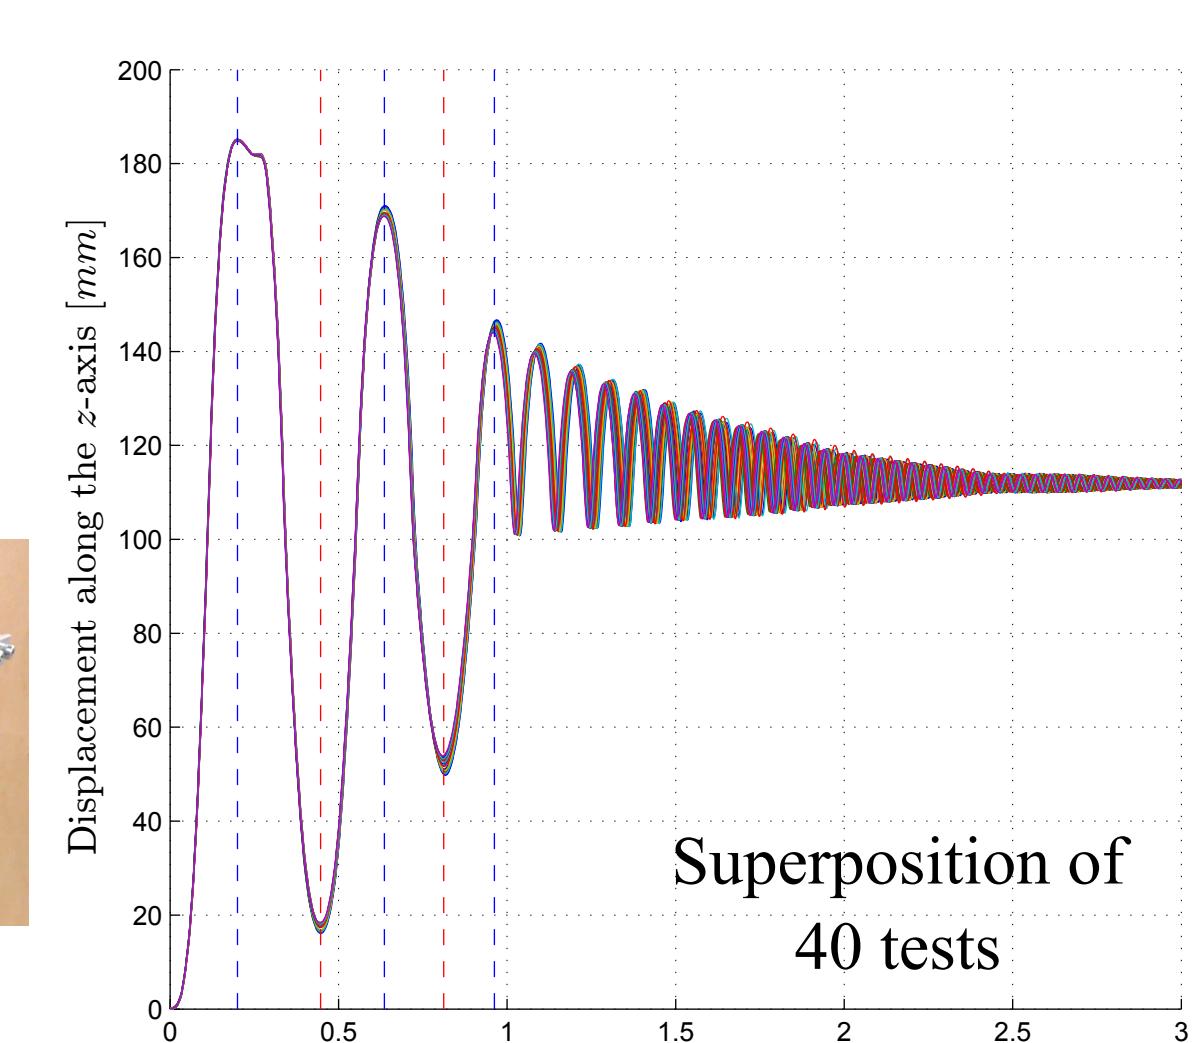

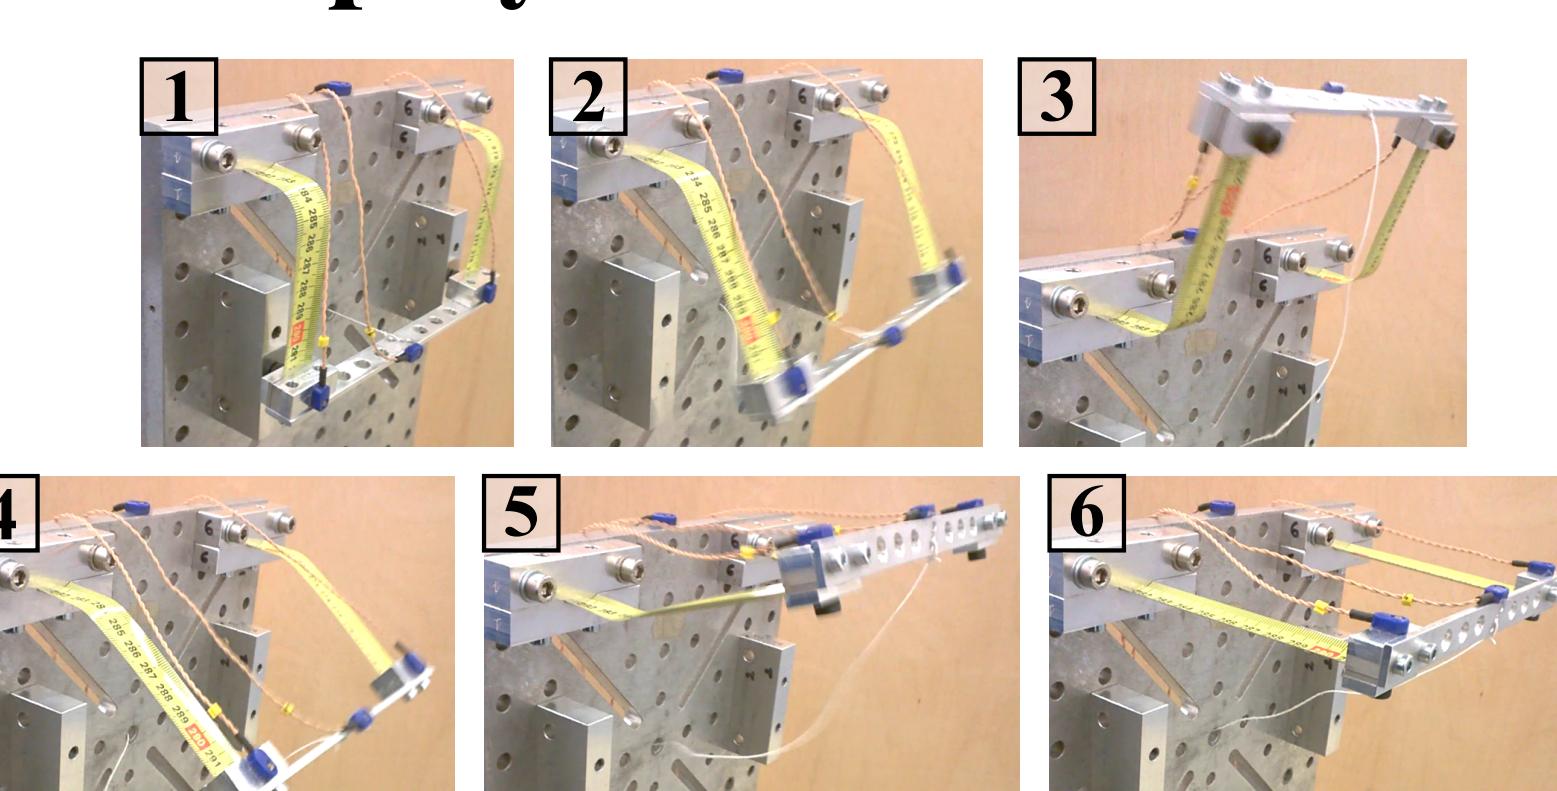

With structural damping

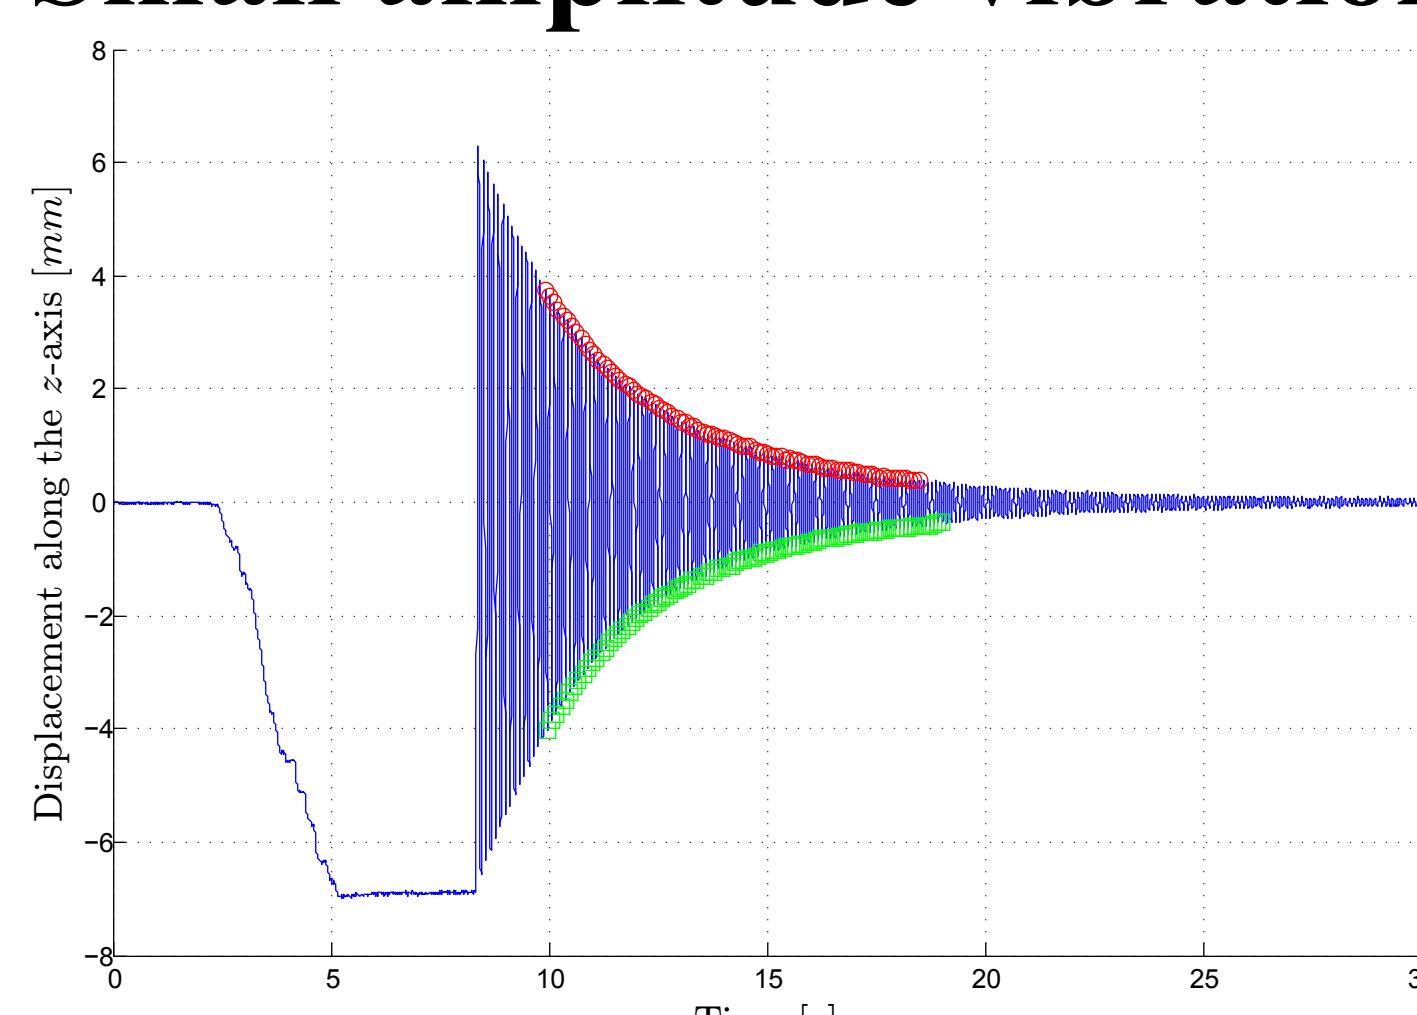

## Experimental validation and damping estimation

**Deployment tests:**

**Small amplitude vibration tests:**

Motion dominated by the first bending mode:

⇒ estimation of the structural damping based on the exponential decay of the response
