

Can science explain consciousness?

Lessons from coma & related states

Measuring brain activity

Altered states of consciousness

- Pathological : coma
- Pharmacological: anesthesia
- Physiological: hypnosis

EEG high density

Measuring awareness

Consciousness \neq global brain function

PET = diagnostic & prognostic markers

→ 42% of normal activity represents the minimal energetic requirement for the presence of conscious awareness

Classifying “resting” fMRI

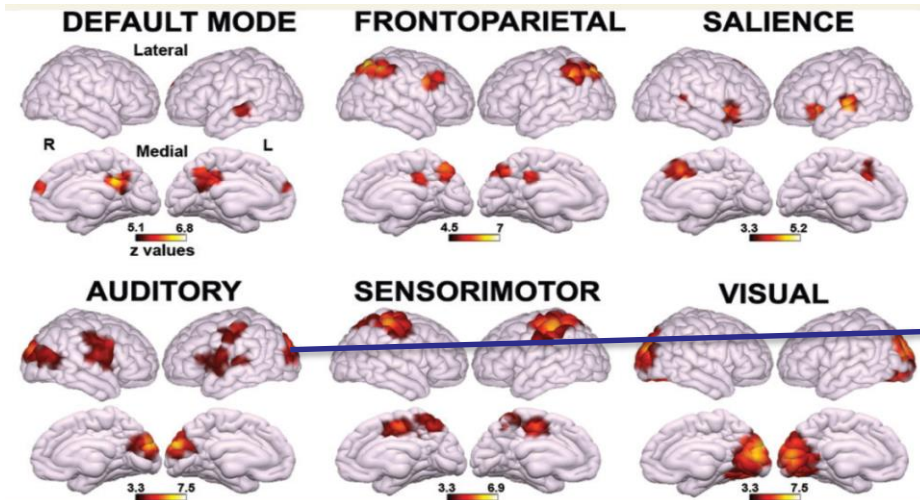

doi:10.1093/brain/aww169

Diagnosis & prognosis

Pain

MCS patients activate the same areas as healthy controls, meaning that the stimulus can be integrated and processed

Diagnostic error after coma

n=103 post-comatose patients

- 45 clinical consensus diagnosis 'vegetative state'
- 18 signs of awareness (Coma Recovery Scale)

↪ 30-40% potential misdiagnosis

JFK COMA RECOVERY SCALE - REVISED ©2004									
Record Form									
Patient:	Date:								
AUDITORY FUNCTION SCALE									
4 - Consistent Movement to Command *									
3 - Reproducible Movement to Command *									
2 - Localization to Sound									
1 - Auditory Startle									
0 - None									
VISUAL FUNCTION SCALE									
5 - Object Recognition *									
4 - Object Localization: Reaching *									
3 - Visual Pursuit *									
2 - Fixation *									
1 - Visual Startle									
0 - None									
MOTOR FUNCTION SCALE									
6 - Functional Object Use †									
5 - Automatic Motor Response *									
4 - Object Manipulation *									
3 - Localization to Noxious Stimulation *									
2 - Flexion Withdrawal									
1 - Abnormal Posturing									
0 - None/Flaccid									
OROMOTOR/VERBAL FUNCTION SCALE									
3 - Intelligible Verbalization *									
2 - Vocalization/Oral Movement									
1 - Oral Reflexive Movement									
0 - None									
COMMUNICATION SCALE									
2 - Functional: Accurate †									
1 - Non-Functional: Intentional *									
0 - None

Research

A survey on self-assessed well-being in a cohort of chronic locked-in syndrome patients: happy majority, miserable minority

Marie-Aurélie Bruno,¹ Jan L Bernheim,² Didier Ledoux,¹ Frédéric Pellas,³
Athena Demertzi,¹ Steven Laureys¹

Near-death experiences

99% positive
1% negative

140 coma

- anoxic (45)
- traumatic (30)
- other (65)

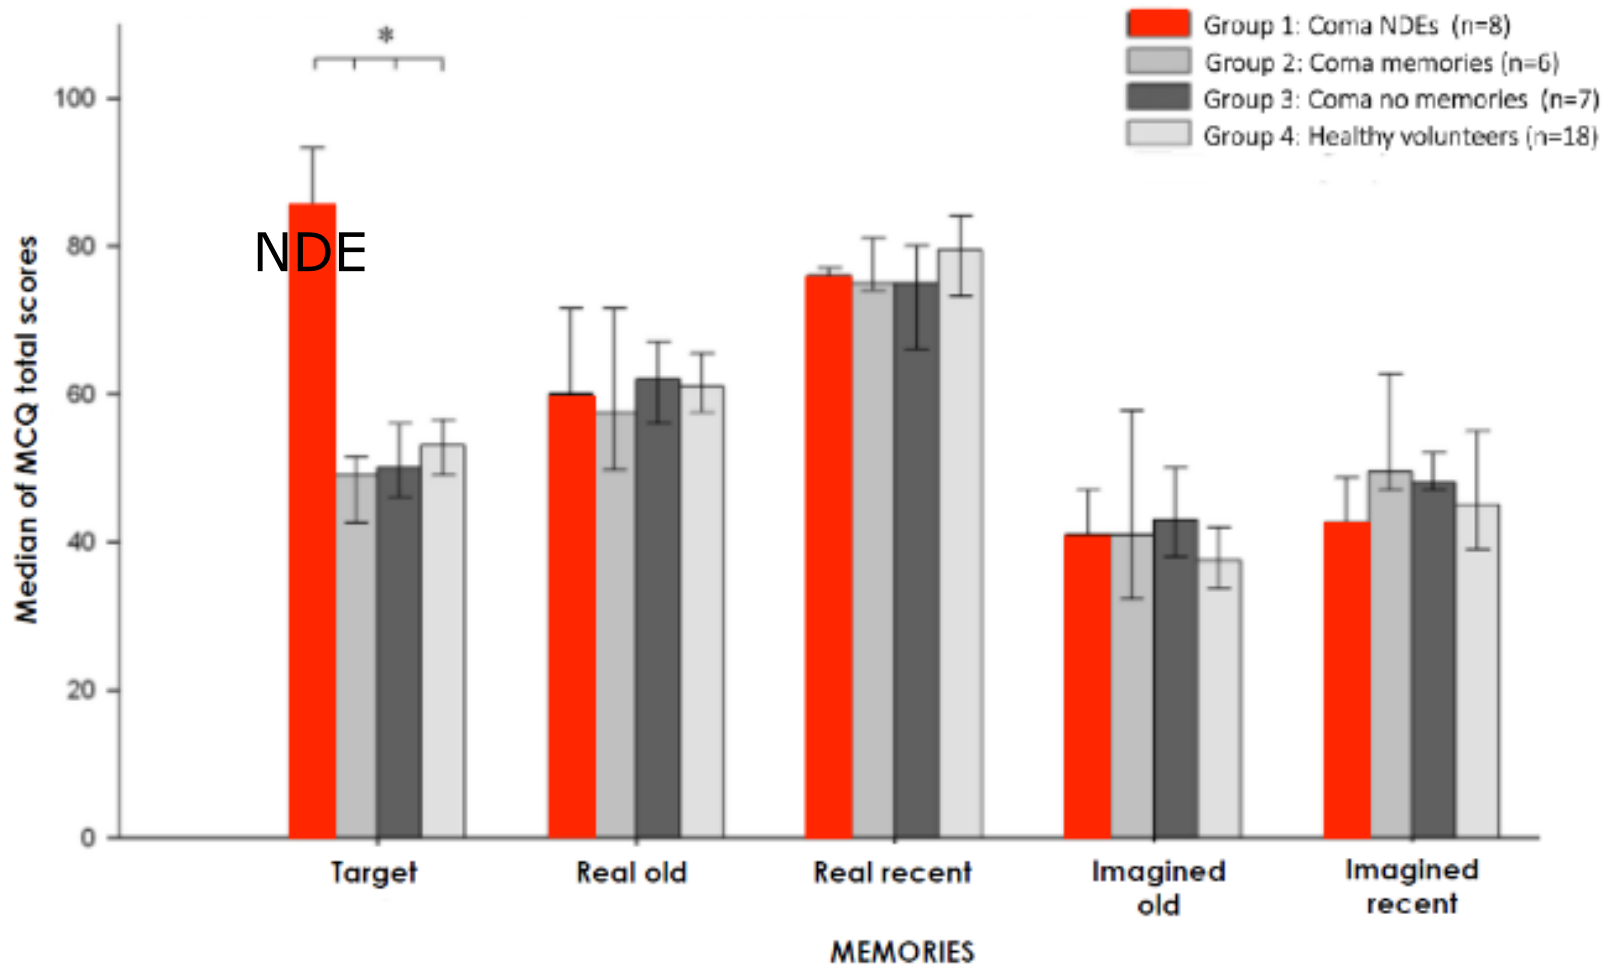

50 non-coma

Temporality of features

Near-death experiences memories

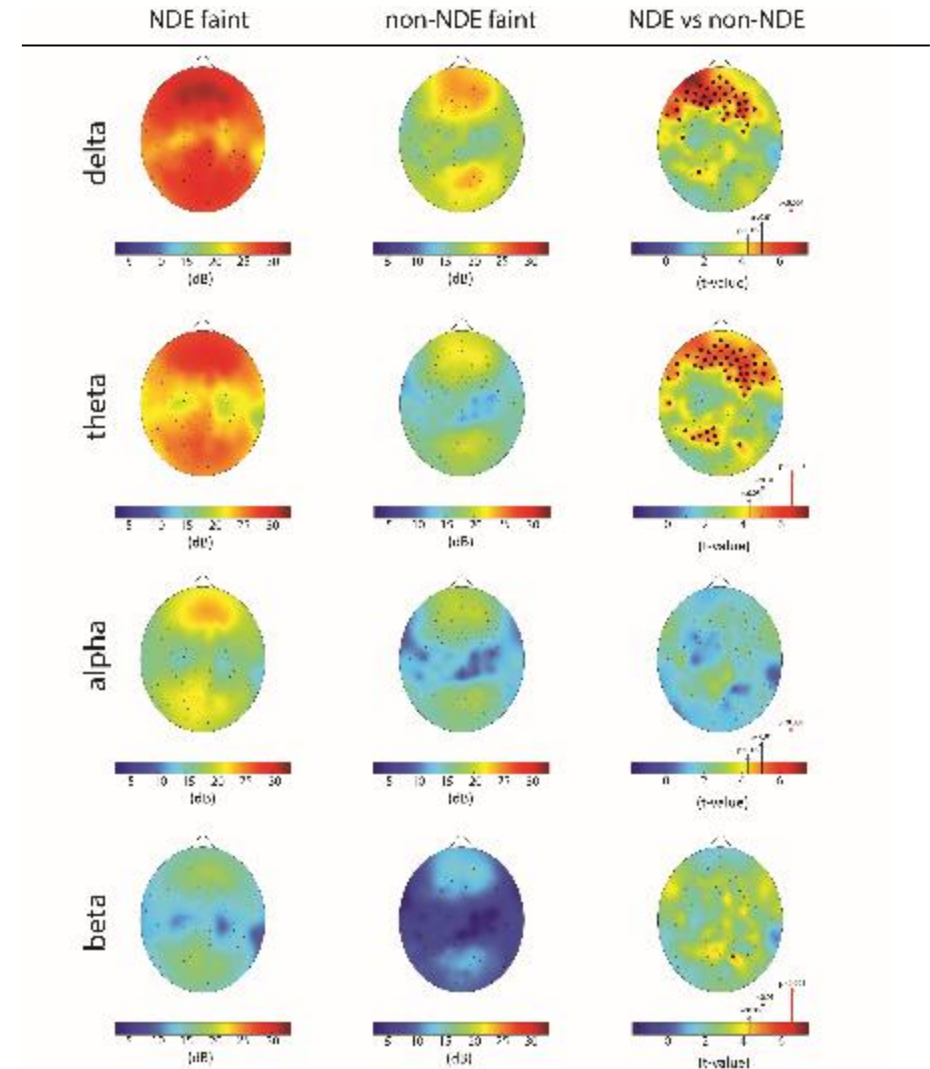

Near-death experiences

Brain function in syncope-induced
near death experiences in normal
healthy volunteers

43% reported a NDE as
defined by the Greyson NDE
scale

“Clinical” death VERSUS brain death

Sometimes confusion!

! Remember that not a single patient who showed clinical criteria of brain death has ever recovered consciousness !

BRAIN DEATH

Human conscious awareness

- ≈ emergent property of collective critical neural network dynamics,
involving a frontoparietal global workspace
- ≈ still not fully explained

Diagnostic use

- ≈ 40% misdiagnosis

Prognostic use

- ≈ multimodal imaging
