

Basic numerical processing in genetic syndromes:  
The role of visuo-spatial processing and working  
memory.

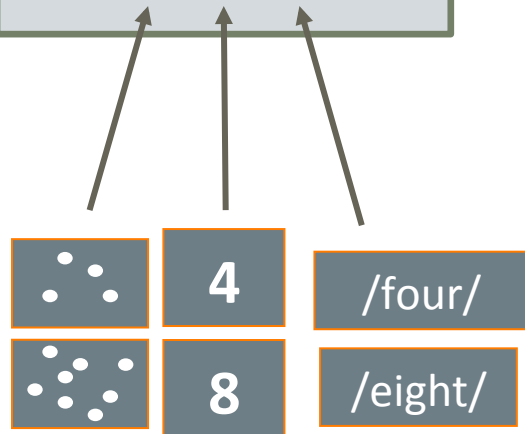

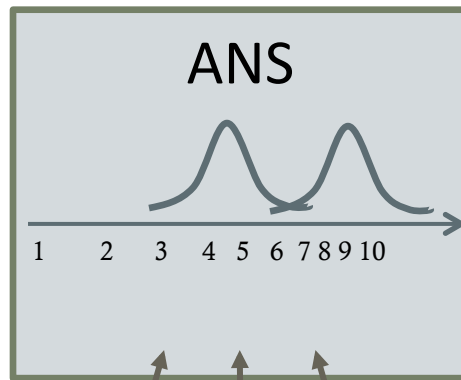

Laurence Rousselle  
Lucie Attout  
Line Vossius  
Marie-Pascale Noël

# Mathematics

# Basic numerical processing

## 1. Approximate Number System

≅ Early sensitivity to numerosities

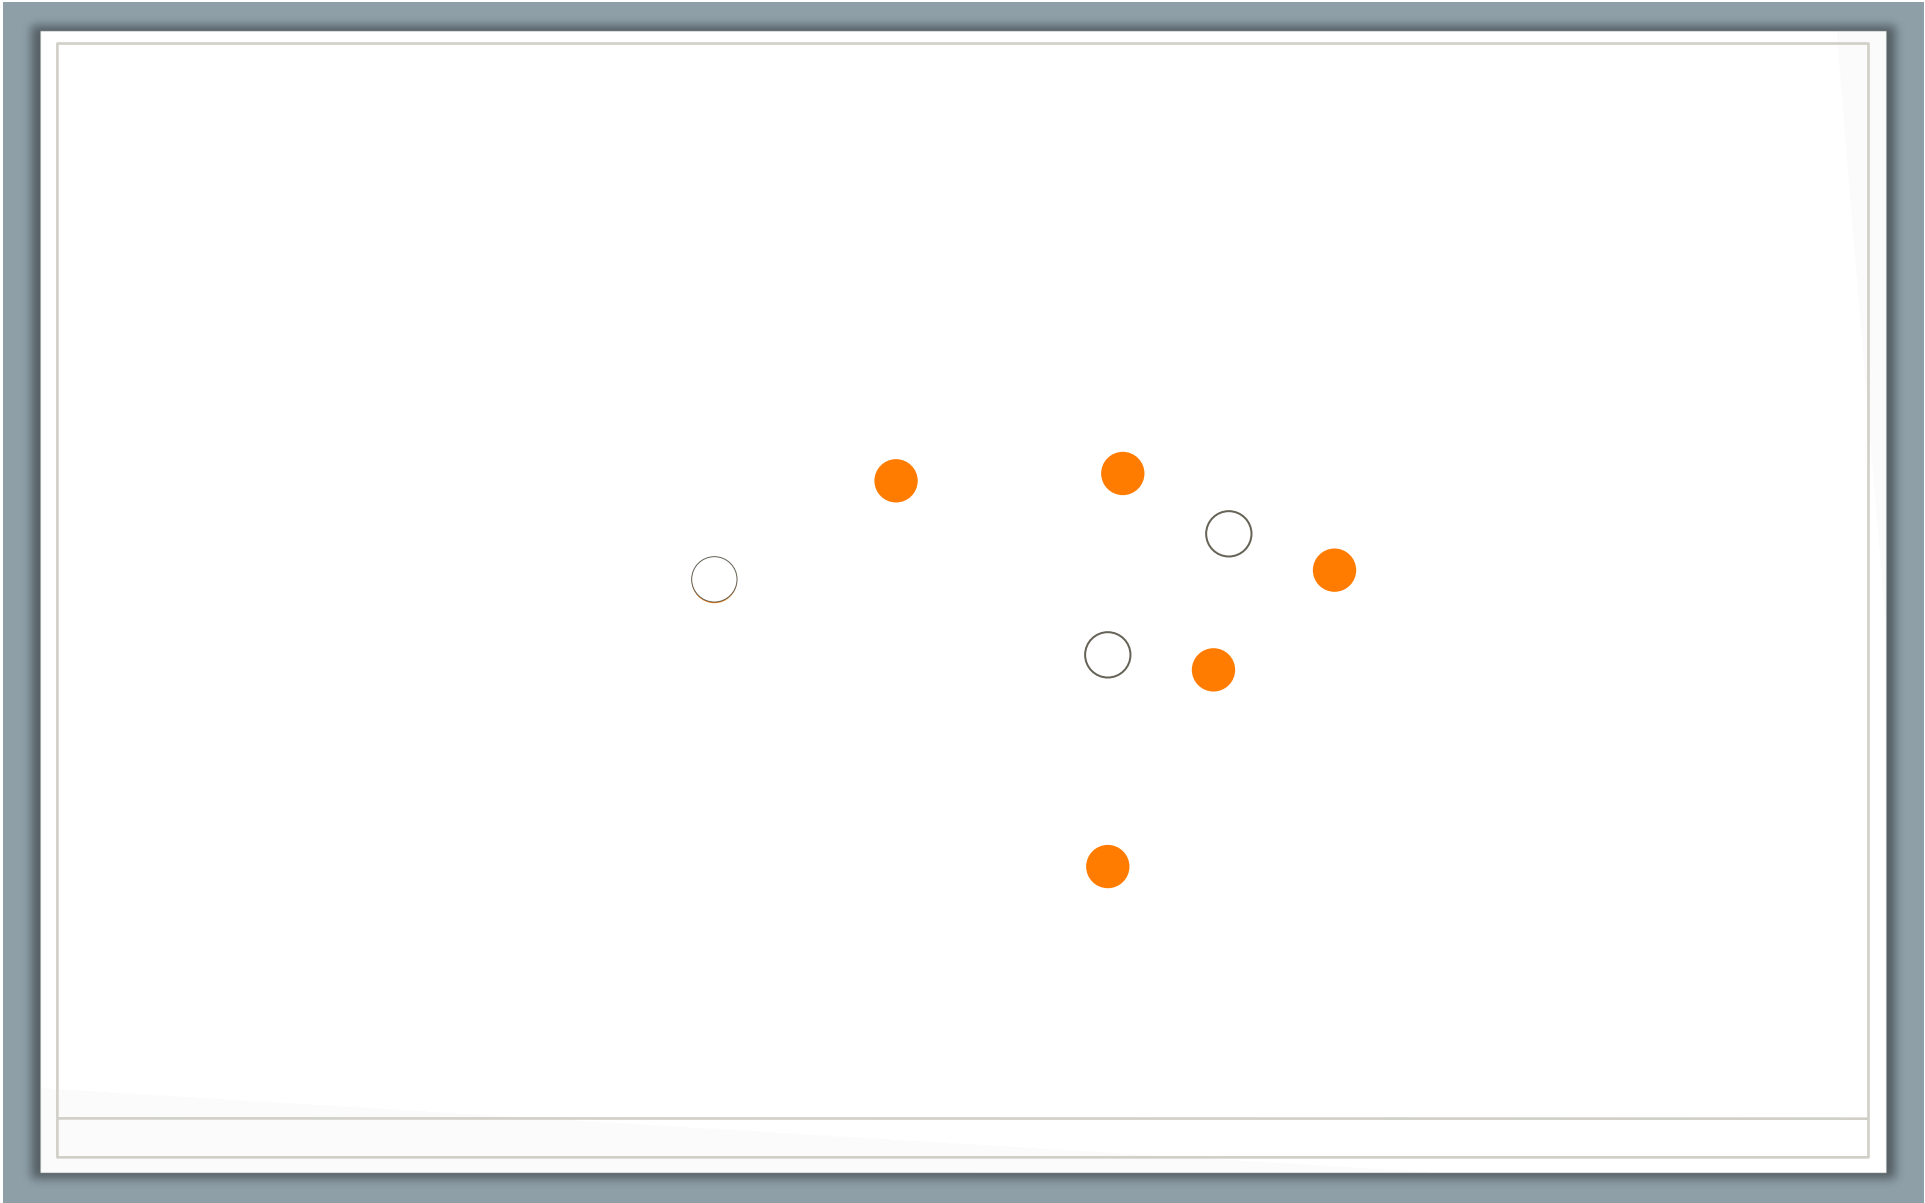

- Approximate : increasing imprecision with numerosity
- Innate/precocious : Independent of learning : babies could discriminate numerosities
- Basis of subsequent learning :
  - ◆ Connection with verbal number words
  - ◆ Connection with arabic numbers

# Basic numerical processing

2. Object-file mechanism : pre-attentional process for keeping track of the location of about 4 stimuli in parallel, without serial displacement of attention

- Subitizing

# Basic numerical processing

2. Object-file mechanism : pre-attentional process for keeping track of the location of about 4 stimuli in parallel, without serial displacement of attention

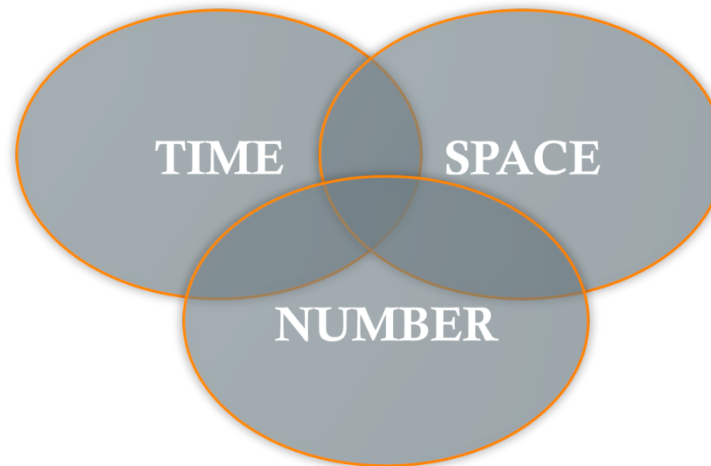

- Subitizing
- Fast and precise
- Innate/precocious : Independent of learning
- Basis of the learning of number word cardinal meaning in young children

*[four]*

# A central magnitude system

Walsh (2003) :

Simon (2008, 22q11 deletion syndrome) : Spatiotemporal processing form the basis of numerical and mathematical competence: Spatiotemporal processing deficit create *“suboptimal foundation for the subsequent development of numerical and mathematical competence, thereby “cascading” impairments into those more academic domains”*

# Mathematic learning disabilities

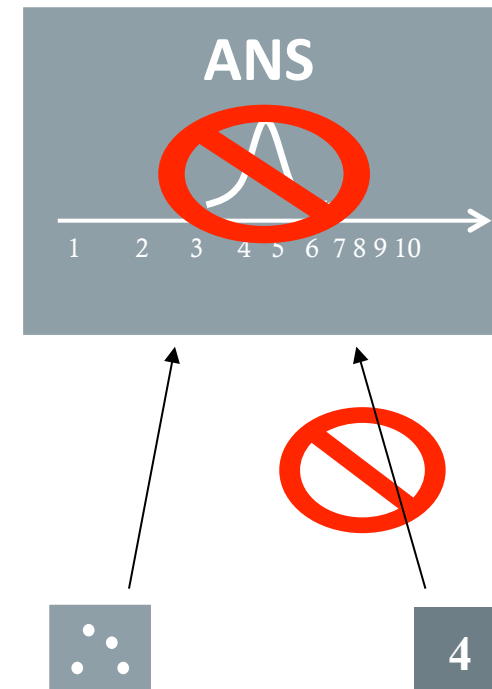

- Specific developmental disorder occurring in children with IQ in the normal range
- Difficulty in
  - learning or comprehending arithmetic
  - in understanding and manipulating numbers
  - and learning arithmetic facts ( $3 \times 4$ ,  $2 + 3$ )
- Frequent co-morbidities with reading learning disorders and ADHD
- Multi-determined learning disorder

# Mathematic learning disabilities

## Functional origins of MLD?

- ◆ Non numerical factors:
  - working memory (calculation and arithmetic fact)
  - sensitivity to interference (arithmetic fact)
  - finger agnosia (calculation and learning arithmetic fact)
- ◆ Numerical factors:
  - Basic inability to represent quantities (number sense)
  - Basic impairment of the ability to connect symbolic numbers to their meaning

# Genetic influences

- Family studies (including 1 child with poor math competence) : Higher prevalence of poor math competence in father, mother and siblings (Shalev et al., 2001)
- Twin studies : Concordance rate of math learning disability reach 58% in monozygotic twins and 39% in dizygotic twins (Light & Defries, 1995)
- Higher prevalence of MLD in patients with Turner, X-Fragile, Williams or 22Q11 deletion syndrome.

Ex : 42-79 % prevalence of MLD in girls with Turner

➔ **interindividual ≠ in math partially accounted for by the genotype**

# Mathematical development in genetic syndromes

- Genetic syndromes ....Why?
  - Better understand genotype-phenotype relationships
  - Opportunity to track early the origin of their math learning disorders
  - ➔ Model of Mathematics learning difficulties (MLD):
    - Distinguishing different trajectories leading to MLD
    - Examining how their particular cognitive profile can contribute to number processing difficulties (working memory impairment, visuo-spatial disorders)

# Cross syndrome studies

- Three genetic syndromes
  - ➔ Turner, 22q11.2 and Williams
- Associated with MLD
- Divergent IQ
- Similar cognitive profile

# Overall description

Turner	22q11.2	Williams
<ul style="list-style-type: none"> <li>➤ Deletion of one of the two X chromosome X : Complete (45X0), Partial (45Xλ), Mosaic (45X0/46XX)</li> </ul>	<ul style="list-style-type: none"> <li>➤ Deletion of 30 à 40 genes on the long arm (q) of the chromosome 22, region 11.2</li> </ul>	<ul style="list-style-type: none"> <li>➤ Deletion of 20 à 30 genes on the long arm (q) of the chromosome 7, region 11.23</li> </ul>
<ul style="list-style-type: none"> <li>➤ 1  : 1900 à 4500</li> </ul>	<ul style="list-style-type: none"> <li>➤ 1 : 4000 à 6000</li> </ul>	<ul style="list-style-type: none"> <li>➤ 1 : 7500</li> </ul>

# What about the origins?

- Up to now : Information about the *nature* of the difficulties experienced quite late in the development
- But no information about the *origins* of these difficulties, about basic numerical processing (= foundation of math competence)

Magnitude representation  
Subitizing

# Basic numerical processing

	Turner	22q11.2	Williams
Non numerical magnitudes	<b>KO</b> (no control for IQ)	<b>KO</b> (no control for IQ)	No data
Non symbolic number magnitudes	No data	No data	<b>KO</b>
Quantités numériques symboliques	Contradictory results	<b>KO</b>	<b>KO</b>
Subitizing	<b>KO</b> (no control for IQ)	<b>OK</b>	<b>OK</b>

Hypothesis : Basic deficit of magnitude representation

# Basic numerical processing in genetic syndromes

Premature conclusion...

→ Only tested with visual stimuli, some of them requiring to process their spatial position

**But**, all have visuo-spatial processing impairment

- ➡ How do they process numerical and non numerical magnitudes in tasks with no visuo-spatial processing requirement?
- ➡ What is the impact of their cognitive profile (visuo-spatial and working memory deficit) on their ability to process magnitude?

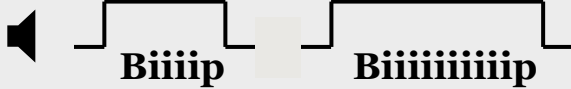

# Participants

Turner	22q11.2	Williams
<ul style="list-style-type: none"><li>• 20 patients with TS (mean CA: 18 [7-33 y-o])</li><li>• 20 typically developing children and adults matched on chronological age (mean CA : 18 [7-34 y-o])</li></ul>	<ul style="list-style-type: none"><li>• 27 patients with 22q11DS (mean CA : 10;7 [5-23 y-o])</li><li>• 27 typically developing children matched on verbal mental age (mean CA: 7;10 [3-13 y-o])</li><li>• 27 typically developing children matched on visuo-spatial abilities (mean CA: 7;2 [3-12 y-o])</li></ul>	<ul style="list-style-type: none"><li>• 21 patients with WS (mean CA : 22;1 [5-52 y-o])</li><li>• 21 typically developing children matched on verbal mental age (mean CA: 7;6 [4-11 y-o])</li><li>• 21 typically developing children matched on visuo-spatial abilities (mean CA: 6;1 [3-10 y-o])</li></ul>

# Tasks

Contrasting magnitude comparison tasks with different visuo-spatial and working memory processing requirements

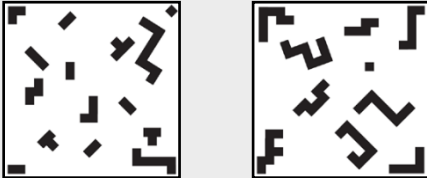

## Non numerical magnitudes

Visual	Auditive
« the longest stick ? »	« the longest sounds ? »
	

# Tasks

Contrasting magnitude comparison tasks with different visuo-spatial and working memory processing requirements

## Numerical magnitudes

Visuo-Spatial ++	Visuo-spatial - -	Auditive
« who has more pieces of puzzle? »	« Who flashed more »	« Who buzzed more ? »
		

# Stimuli

**Table 1.** Pairs of Magnitudes Presented in the Numerical and Non-Numerical Comparison Tasks.

	Ratios					
	1/2	2/3	3/4	5/6	7/8	8/9
Numerosities	7-14	6-9	6-8	5-6	7-8	8-9
	8-16	10-15	12-16	10-12	14-16	16-18
Lengths <sup>a</sup>	70-140	60-90	60-80	50-60	70-80	80-90
	80-160	100-150	120-160	100-120	140-160	160-180
Durations <sup>b</sup>	525-1050	450-675	450-600	375-450	525-600	600-675
	600-1200	750-1125	900-1200	750-900	1050-1200	1200-1350

Weber fraction :

- Measure < from psychophysics to determine the smallest perceptual difference that could be perceived > acuity
- index of **numerical acuity**

# Tasks

Contrasting magnitude comparison tasks with different visuo-spatial and working memory processing requirements

## **Subitizing task**

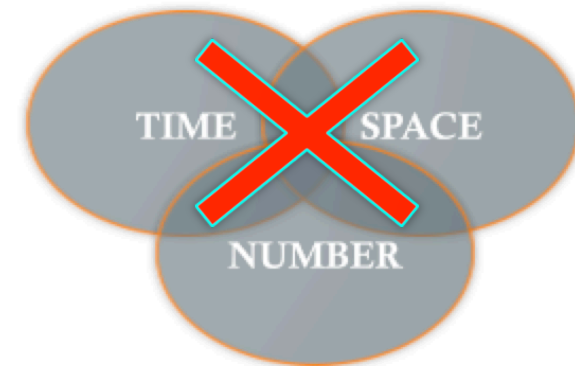

200 ms

# Predictions :

## Global magnitude deficit

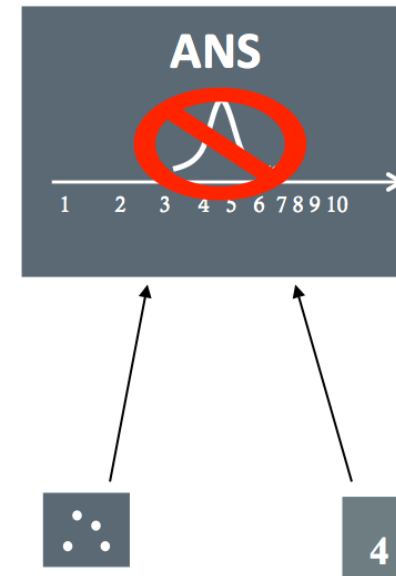

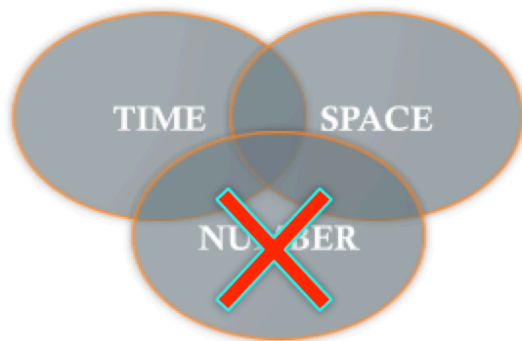

- All tasks impaired except subitizing
  - Length
  - Duration
  - Collection
  - Sequences of dots and sounds

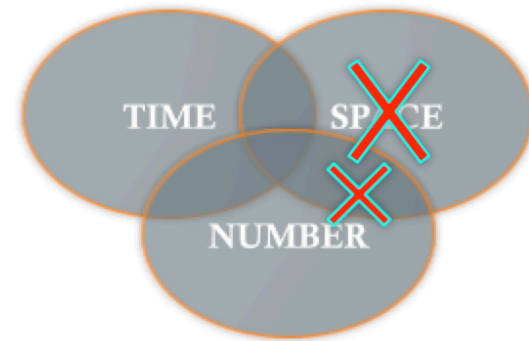

# Predictions: Approximate Number System

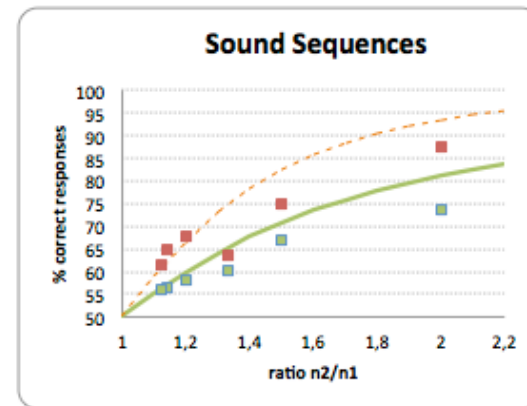

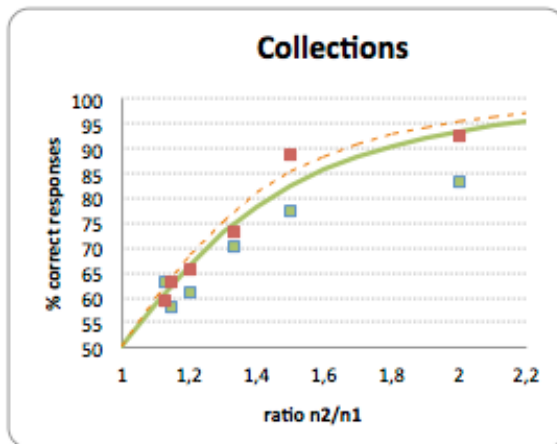

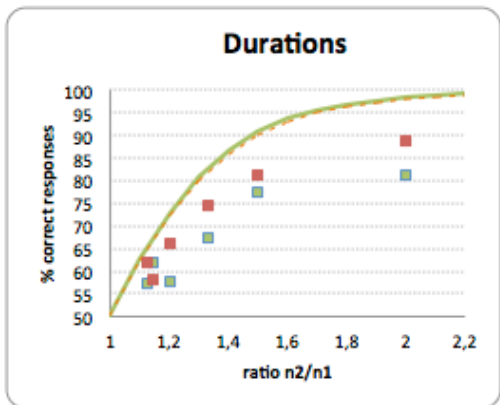

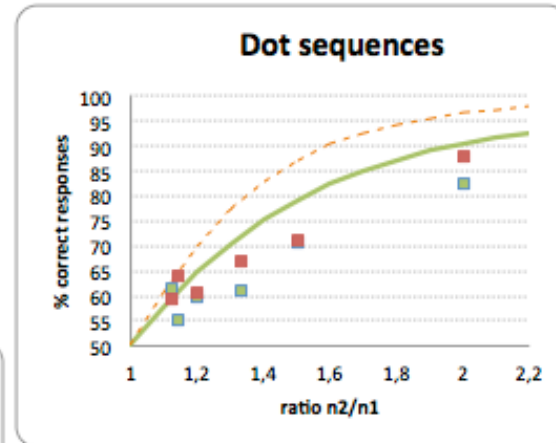

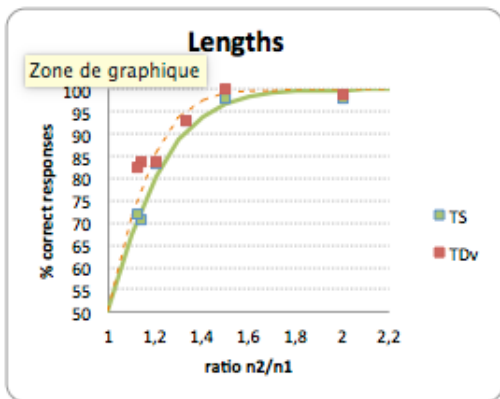

- Deficit in non symbolic numerical comparison tasks
  - Collection
  - Sequence of dots
  - Sequence of sounds

# Predictions: Non numerical factors

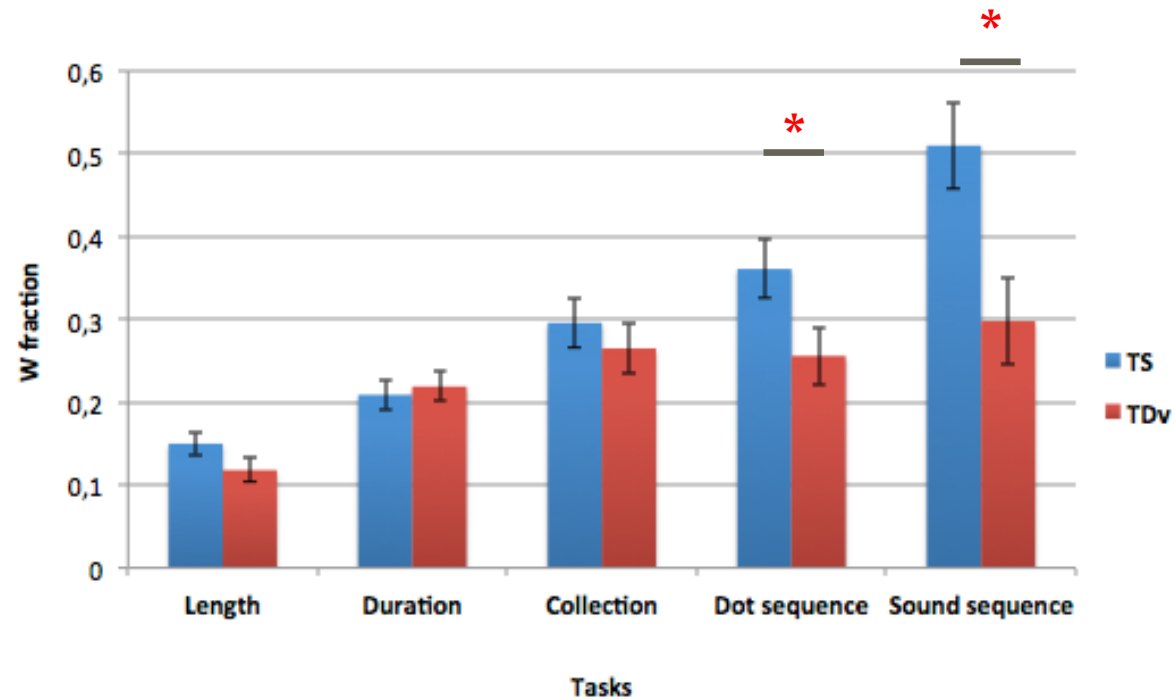

- Impact of visuo-spatial deficit
  - Lengths
  - Collections
- Impact of working memory impairment
  - Sequence of dots
  - Sequence of sounds

Williams

# Conclusion

None the genetic condition is associated with a global magnitude deficit

None of them presented a specific deficit non symbolic number magnitude

Their deficit in basic numerical processing tasks results from other non-numerical impairment :

- ◆ Working memory impairment in Turner syndrome
- ◆ Visuo-spatial deficit in 22q11DS syndrome
- ◆ A mix of both for Williams syndrome
