Conceptual Illustration of Neurological Disorders plotted on axes of motor and cognitive function

1. Cognitive assessment of people with disorders of consciousness:
 - MCS and EMCS
 - Framework for the clinician to carry out basic cognitive assessment
 - Not a rigid ‘test’
 - Range of cognitive domains, (basic mood assessment, basic insight assessment)

2. Comparison of behavioral performance with neuroimaging
 - Hypothesis:
 - Resting state networks’ functional connectivity corresponds to behavioral performance at several subtests

Methods

- 3 patients
- Behavioral assessments
CAVE -
Output using eye movement

Conclusions

- CASE 1: Good cognition // preserved FC
 - CASE 2: Higher-level cognitive difficulties // atypical FC ?
 - CASE 3: Impaired cognition // altered FC, mainly visual/auditory/salience networks, but caution!
- Multimodal neuroimaging // CAVE assessment
- Extended CAVE harder ++
 - /!\ visual/auditory impairment!
 - Perspectives
 - Increase the sample!
 - Statistical comparisons with control group
 - Controlled order of subtests
 - Improvement of extended CAVE items
