

AN ACOUSTIC ODYSSEY:

CHARACTERISATION OF THE VOCAL FISH COMMUNITY INHABITING NEPTUNE SEAGRASS MEADOWS ACROSS THE MEDITERRANEAN SEA

Marta Bolgan¹, Lucia Di Iorio², Thanos Dailianis³, Ignacio Catalan⁴, Pierre Lejeune⁵
& Eric Parmentier¹

Scorpionfish

The chordophones

Lacking swimbladder

High variability within and between species
in number and length of tendons (i.e. strings)

Vocal community

Aggregation of species that produce sounds by using internal or external sound-producing tools and which interact acoustically in a specific habitat (Farina & James, 2016).

**Fish acoustic communication has rarely been studied at
community level**

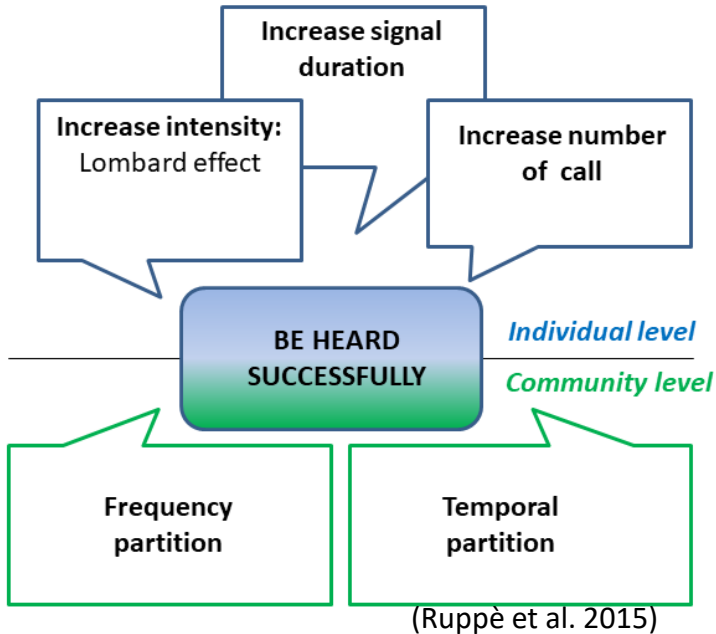

Only one study on fish vocal communities in the Mediterranean Sea (rocky reefs)

Desiderà et al. (2019). MEPS 608, 183-197

Acoustic niche hypothesis (ANH)

Individuals in acoustic communities compete for the use of the sound resource for communication (niche competition)

ACOUSTIC NICHE HYPOTHESIS (Krause, 1993)

To avoid interference, fish species sharing the same acoustic space have co-evolved to **exploit different frequency bands**

➤ **Frequency partition**

And/ or to emit sounds at **different time of the day/ year**

➤ **Temporal partition**

Characterisation of the vocal fish community inhabiting *Posidonia oceanica* meadows

AIMS

- ❖ Characterise the **vocal fish community** of the pivotal Mediterranean environment of *Posidonia oceanica* meadows across the Mediterranean basin
- ❖ Is there any **temporal** or **spectral partition** of fish vocalizations? Testing ANH (Acoustic Niche Hypothesis)

Simultaneous Static Acoustic Monitoring (SAM)

Mallorca, Palma Bay Marine Reserve

Corsica, STARESO

Crete, Seafloor observatory

Simultaneous Static Acoustic Monitoring (SAM)

- Synchronised recordings
- Similar environmental conditions (habitat, depth)
- One month of data during the peak of fish vocal season (July)

Characterisation of the vocal fish community

Manual scrolling (5 days per site)

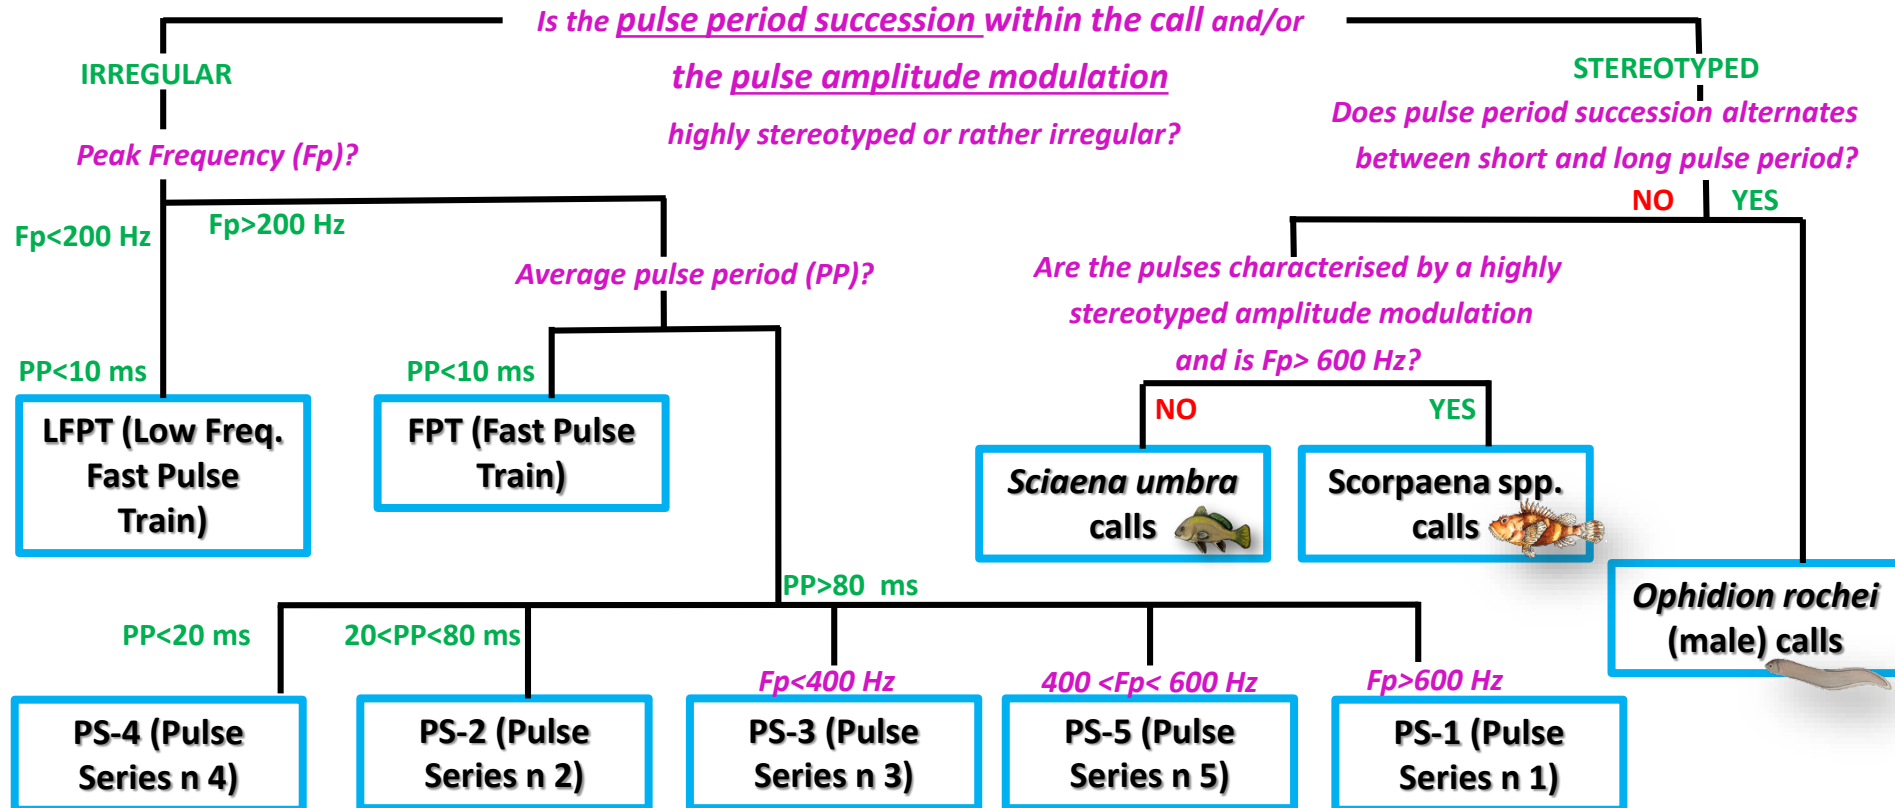

Abundance evaluated on a categorical scale,
i.e. **abundance score**

ranging from 0=absence to 4=chorus

Diversity evaluated as number of sound types, i.e. **acoustic richness**

Sound types have been categorised on the basis of a dichotomous framework

see Desiderà et al. (2019). MEPS 608, 183-197

Sound types have been categorised on the basis of a dichotomous framework

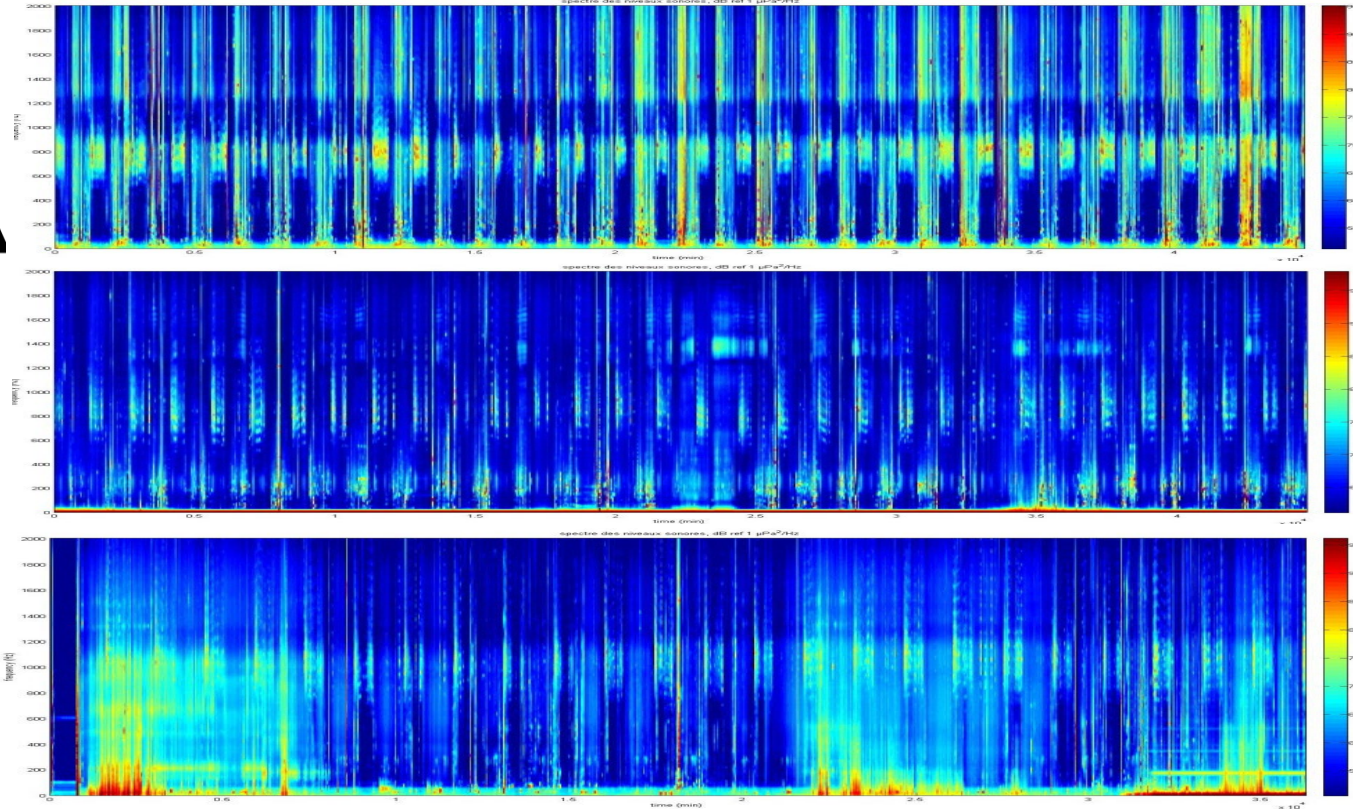

Fish active acoustic space: one month of recording (743 hours: July)

Fish active acoustic space: one month of recording (743 hours: July)

Day-time: Boat traffic

MALLORCA

Vocal fish community of *P. oceanica* meadow: main findings

- ❖ Day-time: boat noise, decreasing West to East, only some rare *Scorpaena's* Kwa
- ❖ Night time: dominated in abundance by the *Scorpaena's* Kwa (decreasing West to East)
- ❖ Acoustic diversity increases West to East
- ❖ The spectral acoustic space exploited by fish is larger in Crete (i.e. site with highest acoustic diversity)
- ❖ We observe some degree of temporal and spectral partition overlap.
- ❖ **Acoustic niche as a hypervolume → consider more axis (e.g. tempo, rhythms etc)**

FURTHER STUDIES ARE NEEDED
